Ensured by a soft durable metal seating to a specially reinforced mount (Pat 7359)

(2) EASY TO ATTACH
The shape of the Summit mount enables it to be firmly gripped between the thumb and fore finger

(3) LEGIBLE NUMBERING
Owing to the shape and construction of the mount the needle size is cast on it in very legible characters

(4) APPEARANCE
The special metal with which the mount is made returns a perfect appearance throughout the life of the needle

Heat helps you fight PNEUMONIA!

by relieving *pain* promoting *relaxation* and *rest* and lessening apprehension

These certainly are vitally important considerations tending to make your task *lighter* by making the patient's comfort *greater* and enabling you to carry the case along by routine medication until it has run its course

The Victor Inductotherm offers the *ideal* means of heating human tissues not only because of the proved effectiveness of the basic principle—a short wave circuit utilising *electromagnetic induction*—but because of the extreme simplicity of application and absolute control of dosage The patient's coverings need not be disturbed there need be no weight on or direct contact with the body there are no electrodes to apply to the skin surface There is deep, soothing beneficient heat that comes instantly when the switch is closed

You *should* know the Inductotherm more *intimately* for its use is definitely indicated wherever heat is indicated You *can* learn all about it—without obligation—simply by writing for Publication AU3

BOWDEN HOUSE,

HARROW ON-THE HILL,

For the residential treatment of Functional Nervous Disorders

No case under certificate nor under the M T A

This home which was founded in 1911, is designed to provide for psychoneurotics a curative environment associated with modern psychological treatment modified to suit each individual patient The treatment is in the hands of three experienced psychotherapists and most patients receive three hours of analytical treatment per week Occupational therapy of many varieties is available but not obligatory Recreations include tennis badminton billiards etc

On admission patients are examined by the diagnostic physician who advises on all physical treatment As far as possible all necessary pathological examinations are carried out by the pathologist in the laboratory on the premises

UNIVERSITY OF LONDON

BRITISH POSTGRADUATE MEDICAL SCHOOL (DEPARTMENT OF PATHOLOGY)

DIPLOMA IN CLINICAL PATHOLOGY

A COURSE OF STUDY in the academic year 1938-39 will be held for this Diploma commencing on October 3rd 1938. The Course will occupy twelve calendar months. The subjects embraced will be:—

HAEMATOLOGY AND CLINICAL PATHOLOGY
PATHOLOGICAL CHEMISTRY
BACTERIOLOGY
MORBID ANATOMY AND HISTOLOGY

The Course will commence with Haematology and Clinical Pathology which will occupy about six weeks and will be followed by the Course in Pathological Chemistry which will occupy about the same time. The Courses in Bacteriology and Morbid Anatomy and Histology will run concurrently and occupy about six months. For the last three months of the Course students will be occupied in the practice of routine work in the laboratories of the Department and in revision work. The number of places in the Course is limited and students will be selected shortly before the Course is due to commence.

Fee forty guineas.

In addition to the full Course it will probably be possible to enrol a limited number of students for the subjects of Pathological Chemistry and Clinical Pathology and Haematology separately. The Course in each subject lasting about six weeks. Fee for either Course nine guineas.

Further particulars may be obtained from the Dean, British Postgraduate Medical School, Ducane Road, Shepherd's Bush, London, W.12.

UNIVERSITY OF CAMBRIDGE

DIPLOMA IN MEDICAL RADIOLOGY AND ELECTROLOGY

The next Course of Study for the Diploma begins on October 4th, 1938, and lasts three months. It comprises:—

(a) Four months in theoretical physics, RADIOLOGY and PATHOLOGY.

(b) Three months further instruction in RADIOLOGY and ELECTROLOGY together with three months clinical work in the Radiological Department at a hospital approved by the Medical Committee of the Diploma.

(c) Two months experience as CLINICAL ASSISTANT in the Radiological Department of a hospital approved by the Committee. Hospitals in London and in the Provinces and Overseas have been approved for the purpose of the Course.

Examinations for Part I (Physics) will be held in February and July, 1939, and for Part II (Radiology, Electrology and Pathology) in July and October, 1939.

The University has decided that the Diploma shall cease to be granted after 1941. The last Course for the Diploma will start in October, 1940, and the last examination will be held in October, 1941.

The Courses are open to men and women who are medical qualifications approved by the General Medical Council for purposes of registration and who satisfy the Committee that they have had sufficient post-graduate clinical experience.

Further information about the Courses may be obtained from:—

Appointments for Medical Officers in the ROYAL AIR FORCE

Medical men are invited to apply for Short Service Commissions in the Royal Air Force. Candidates must be registered under the Medical Acts and be not more than 31 years of age on entry.

The period of service is 3 years—extendible to 5 years. A gratuity of £400 or £1,000 is payable at the termination of 3 or 5 years respectively. Permanent commissions are awarded in a number of cases. These offer a pensionable career with the opportunity of extra leave on full pay for specialised study. Applicants who hold—or are likely to hold—post-graduate appointments in civil hospitals may on joining the Royal Air Force be seconded until the termination of their appointments (for a period not exceeding one year). An antedate of commission up to twelve months is allowed for appointments held at approved hospitals.

Fuller information can be obtained from The Director of Medical Services, Air Ministry, Kingsway, London

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in September, 1938.

Candidates below the age of 28 years are preferred and they must be registered under the Medical Acts. No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board.

Selected candidates will be entered for Service for a period of three years, which if desired is usually extended to five years at the discretion of the Admiralty.

At the end of three years' service, officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000.

At the end of five years' Short Service, permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career. Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax).

Full opportunities exist for transfer to the permanent list, and periods of unemployed or half pay are very rare. The assistance of private income is not necessary for the purpose of supplementing official pay and allowances.

Opportunities are available for officers on the permanent list for post-graduate study, to specialise, to take higher examinations and to obtain further qualifications.

Naval Medical Officers are included in the Scheme for Marriage Allowance under the same conditions as for other Naval Officers.

Copies of the regulations for entry and conditions of service, including rates of pay, allowances and retired pay, may be obtained from the Medical Director General of the Navy, Admiralty, S.W.1, and from the Deans of all Medical Schools.

Applications for entry from intending candidates must be received not later than 31st August, 1938.

PERSISTENT ERUPTIONS QUICKLY RELIEVED*

Because it contains a perfectly natural antiseptic—distillates of peat—Sphagnol Ointment has a rapid and beneficial effect on skin eruptions It has a twofold action From the first dressing it soothes irritation and burning sensations Then as its antiseptic peat distillates penetrate the local treatment effectively assists in general measures to clear away the toxic matter which is the source of the trouble We have on record many cases in which a decided improvement has been shown after only three days and where before a week had elapsed marked benefit had resulted

In case you have had no personal experience of Sphagnol we shall be pleased to send you a clinical size sample for testing if you will write to Peat Products (Sphagnol) Ltd Dept B M J 9 21 Bush Lane London E C 4

CONTAINS DISTILLATES OF PEAT

EQUIVALENT ALKALIZING VALUES

"The benefit to health which so generally results from the use of diets consisting largely of fruits and vegetables . . may be attributable in part to the fact that these yield alkaline residues . . . in the body"

(Chemistry of Food and Nutrition)

The following table, based on our researches and published data, demonstrates that a teaspoonful of Eno's 'Fruit Salt'—an ordinary dose—is equal in systemic alkalizing value to relatively large quantities of fruit and vegetables Eno is also far more economical

SUBSTANCE	WT OF SUBSTANCE	COST
ENO'S "FRUIT SALT"	0·2 oz = 1 teaspoonful	¼d
Banana	6·4 oz = 2 bananas	2½d
Apple	9·6 oz = 2½ apples	2½d
Tomato	6·4 oz	3d
Pear	9·9 oz = 3 pears	3d
Dates	3·2 oz = 2/5th box	4d

MAJOR ENDOCRINE DISORDERS

By S LEVY SIMPSON, M D, F R C P

200 pp, 25 full pages of illustrations, bound in Sundour cloth, price

10s. 6d. postage 6d

85 GREAT TITCHFIELD STREET, W 1

FOREWORD BY

SIR WALTER LANGDON BROWN, M D, F R C P

Emeritus Professor of Physic, Cambridge

Advances in endocrinology have been occurring so rapidly that it is indeed difficult for the busy medical practitioner to keep pace with them There are encyclopædic works, full of detail, which, however valuable for purposes of reference, are on too large a scale for him to assimilate There are also books dealing purely with the physiology of the ductless glands, necessarily cautious in tone, which naturally do not include the therapeutical aspect There are others which are more frankly speculative

This is a condition of affairs which Dr Levy Simpson has set himself to remedy He is already well known as an original worker and writer on the subject He has, in my judgement, succeeded in a really difficult task, for within a comparatively small compass he has included all the important recent advances Where matters are still *sub judice* he has stated the arguments for and against and then expressed his own opinion, where there is general agreement the reader is not left in doubt His statements are clear and precise and are largely the outcome of his own experience The profession at large should be grateful to him for providing such a useful and much-needed book

JUST PUBLISHED!

HERMAN'S PRACTICE of UROLOGY

A Practical Book

by

LEON HERMAN, B.S., M.D.

Professor of Urology University of Pennsylvania Graduate School of Medicine Octavo of 923 pages with 736 illustrations on 504 figures Cloth 45s net

Dr Herman's new book is truly **To-day's Practice of Urology** It brings to everyone concerned with urological disease a clear concise and specific presentation devoted to the practical everyday methods of diagnosis and treatment

But it is the Family Physician who will especially appreciate and welcome this work Dr Herman has taken into account those factors that enter into the treatment of urological disease as it is most commonly met in general practice He describes each method of examination how to apply it and what it means He contrasts normal with abnormal gives you tests such as the Mosenthal test McLean urea concentration test phenolsulphonphthalein test, etc and their clinical interpretation He gives you methods of treatment that you can institute at once in your own practice Systemic and dietetic measures, with actual prescriptions and menus diuretic treatment use of antiseptics, solutions drugs etc and indications for surgical interference are given in full detail

There is an especially fine discussion of **Gonorrhoea in the male** covering six chapters in which Dr Herman omits no detail of practical importance and assistance The use of sulphanilamide, diathermy repressive treatment hand injection irrigation vaccines intraprostatic injection and other methods are described in the light of Dr Herman's own clinical experience

Five unusually complete chapters are devoted to the **Prostate Gland** and there is a full consideration of **venereal ulcers** including the treatment of chancroid

For sound practical and authoritative guidance in **to-day's methods of clinical diagnosis and treatment** we believe this entirely new book is unsurpassed

THE LANCET says

Professor Herman's book does supply as few textbooks do just those facts about urology of which the medical adviser of a patient should be possessed The chapters on prostatic obstruction for instance contain a description of the various methods of prostatectomy to avoid surgery of the added risk and details of the after-treatment

Here is much information carefully tabulated and statistics formed a to an added risk of certain procedures attached to each are duly Rare diseases of interest mainly to the specialist and all matters are excluded from the text but many conditions such as hæmaturia of the fetal kidney are not generally mentioned in current textbooks are noted and studied

Dr Herman's work is thus exactly what he intends it to be—A practical treatise of diseases of the urogenital system for the use of general practitioners and surgeons

The subject matter is skilfully arranged and the text is well illustrated

MARMITE

its value in reduction of puerperal death rate

PARTICULARS OF GROUP	NUMBER OF WOMEN IN GROUP	PUERPERAL DEATH RATE FROM SEPSIS (per 1 000 total births)
Cases receiving special food ★	10 384	0 09
Cases not receiving special food	18 854	2 91

★ The food given consisted of a certain milk preparation and Marmite The Marmite was rich in the vitamin B complex which was a neuro muscular stimulant

Another point was that Marmite had a very important haemopoietic action which was not understood and was probably not associated with any of the vitamin B constituents at present recognized (*Brit Med Journ Jan 22nd 1938 p 191*)

'AMYTAL'

BRAND

Iso-amyl Ethyl Barbituric Acid

FOR SEDATION AND HYPNOSIS

The tranquil sleep of children is always the envy of less fortunate adults to whom at times this boon is denied because of sickness or other conditions which upset the psychic or emotional equilibrium

'Amytal' supplies the relaxation and sleep which are essential to recuperation of vital forces It may be prescribed wherever there is need to combat insomnia, restlessness, or apprehension A noteworthy margin of safety is characteristic of 'Amytal,' and since destruction of the hypnotic within the body appears to be accomplished rapidly there is little tendency to unwelcome side reactions or after depression

'Amytal' is supplied in ½-gram, ¾-gram, and 1½ gram tablets in bottles of 40 and 500

PLEASANT PROTECTION

'DETTOL' owes its ever increasing use to the fact that it combines high germicidal efficiency with cleanliness and pleasantness

'DETTOL' can be used at really effective strengths without discomfort or even staining—marked advantages over carbolic and cresylic antiseptics Its high bactericidal power is maintained in the presence of blood and other organic matter

'DETTOL' is a clean, clear, non-poisonous fluid, with a most agreeable odour

Sold by chemists in bottles, 1/-, 1/9 3/-, 5/- and 7/6, and in larger sizes for Medical and Hospital use These prices do not apply in Eire or Overseas Sample, and full information on request

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non-narcotic analgesics available Too often however its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available

Alasil provides the beneficial therapeutic effects of pure acetyl-salicylic acid in such a form that it is acceptable even by disordered digestions This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with Alocol a potent gastric sedative and antacid

Since Alasil is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter Alasil is therefore an analgesic antipyretic and anti rheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated

APPLICATION OF

B.D.H. GONADOTROPIC HORMONES

IN THE MALE

Of the two gonadotropic hormones Serogan and Gonan, prepared by the B D H Serogan stimulates the germinal epithelium of the testis leading to active spermatogenesis while Gonan acts primarily upon the interstitial cells and corrective tissue leading to increase in size of the testis marked internal secretory activity and added mobility of the undescended organ

Serogan is thus indicated in the treatment of impotence and sterility in the male Gonan is employed when there is a failure in development of the secondary male sexual characteristics—especially when this is associated with undescended testis

DOSAGE OF SEROGAN IN MALE IMPOTENCE

One ampoule 1000 R U twice weekly for one month Thereafter 200 R U injection may be administered when required

DOSAGE OF GONAN IN UNDESCENDED TESTIS

Gonan 500 R U twice weekly for six weeks Since treatment is designed to cause as gradual a descent of the testis as possible in order to promote closure of the processus vaginalis, a treatment-free interval of one month should be allowed between each six weeks course The optimum age for treatment is generally regarded as being between 9 and 13 years

The commencement of Treatment

The pathological changes observed in the various organs in most diseases are due to the absorption of poisons, either locally or from the intestine

After treating the cause, the next step is essentially elimination of the toxin by the bowels, kidneys and skin

This is especially important in the infectious and acute febrile diseases

It is sometimes overlooked in chronic diseases such as rheumatism, catarrhal diseases and skin diseases, etc

A safe and efficient aperient is found in Andrews Liver Salt Palatable to young and old alike, antacid in action, it is especially useful in febrile conditions, where its effervescing properties relieve thirst and cool the dry, parched mouth

★ N.B.—A large size tin will be sent free on request to any member of the Medical Profession

INDICATIONS FOR 'SANATOGEN' No 6

TUBERCULOSIS

PUBLIC ENEMY No. 5

Since the beginning of the century, the death rate from all causes has fallen by one-third The death rate from Typhoid has dropped from 113 per million to 6 3 in 1936, that from Influenza from 189 to 109, whilst from Measles the death rate has fallen from over a thousand to under three hundred In the first five years of the century, the average mortality rate from Tuberculosis was over 1700, in 1936 it was 657—but it still holds fifth place in the list of causes of death in this country

For these improvements, better sanitation and the raising of the economic level of the poor are mainly responsible Environmental circumstances are important, but so far as Tuberculosis is concerned, *nutrition is evidently the most important factor* An adequate supply of nourishing food constitutes the first line of defence The food must be ample, digestible and absorbable, and must include a sufficiency of proteins, *vitamins and minerals*

'Sanatogen', which is a carbohydrate-free product of 95% pure milk casein with 5% sodium glycerophosphate, has proved itself to have great value in building up the body's resisting power to hostile bacilli It is easily digested and assimilated, and markedly increases the nutritional value of other foods taken with or after it It is notably helpful to the debilitated, rejuvenating cellular activity (including that of the white blood corpuscles) and promoting healthy tissue-building

'SANATOGEN'

(Trade Mark)

A brand of Casein and Sodium Glycerophosphate

Sold by all chemists price 2/3 to 19/9

DOSAGE For children and adults two teaspoonsful three times daily or according to circumstances For infants ½ teaspoonful added to each bottle feed

The word SANATOGEN is the Trade Mark of Genatosan Ltd Loughborough Leicestershire for its tonic preparations of Casein and Sodium Glycerophosphate

Clinical samples and literature available on request to

GENATOSAN LTD., LOUGHBOROUGH, LEICESTERSHIRE.

The Scourge of Diphtheria

can be mitigated by timely immunization

The following prophylactics are made and standardised at
THE EVANS BIOLOGICAL INSTITUTE

APT Evans
(Alum Precipitated Toxoid)

A 'two dose' prophylactic prepared by precipitating the antigenic fraction of formol toxoid of high value with alum. The first injection should be 0·1 to 0·2 cc. and the final injection 0·5 cc. after two weeks. For children of eight years and under.

TAF Evans
(Toxoid Antitoxin Floccules)

T.A.F. should be used when the subject is more than eight years of age. T.A.F. has a high immunizing efficiency whilst reaction is rare.

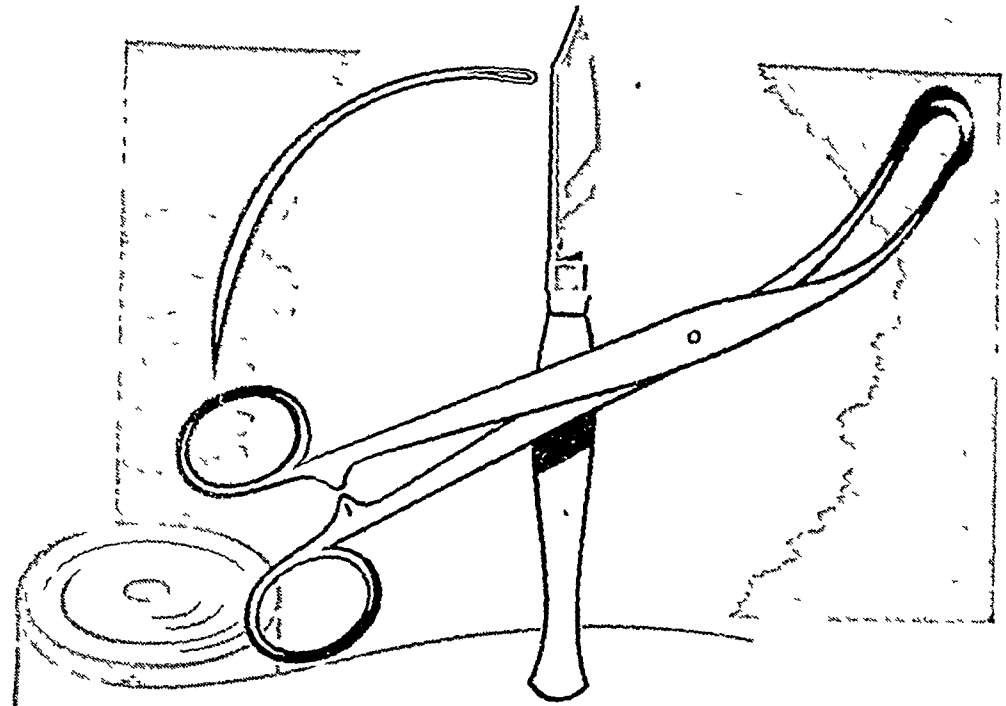
TAM Evans
(Toxoid Antitoxin Mixture)

Produces immunity more slowly and is generally recognized to be less efficient than A.P.T. and T.A.F.

FT. Evans
(Formol Toxoid)

An efficient prophylactic. It may cause disturbance in some older children and in adults. It is recommended that its use be restricted to children between 1 and 8 years of age.

Dosage of F.T., T.A.M., and T.A.F.



These three dose prophylactics are administered subcutaneously. With the F.T. and T.A.M. the doses are 0·5 cc., 1 cc. and 1 cc., but with T.A.F. each 1 cc. A course of 0·5 cc., 1 cc. and 1·5 cc. has also been suggested. It is recommended that the intervals between the injections should be one or preferably two weeks.

In the very few instances where a positive Schick reaction is obtained after such a course of treatment further injections are necessary to establish immunity. It is recommended that the Schick Test be made not earlier than eight weeks after the third injection.

(Special prices and detailed literature will be forwarded to Public Health Authorities)

ONE HUNDRED AND SIXTH ANNUAL MEETING, PLYMOUTH, 1938

President's Address

THE PROFESSION AND THE PUBLIC

BY

COLIN D LINDSAY, M D,

Emeritus Physician Prince of Wales's Hospital Plymouth Consulting Physician Royal Eye Infirmary Plymouth Consulting Physician Tavistock Hospital

In the first place I wish to thank you for the honour you have done me in electing me President of the B M A Specially I wish to thank my colleagues in the Division who by nominating me have given me a token of friendship that I prize above most things I consider this honour one of the greatest within the profession and my sense of inadequacy is at its height at this moment when I am faced with the problem of delivering an address that will be worthy of the head of this great Association Previous holders of my office have often been pre-eminent in one or other branch of medical science and they have made this address the vehicle of some valuable addition to or survey of medical knowledge I can claim no such pre eminence For forty years I have been in practice both as a general family doctor and as a consulting physician They have been eventful years in the development of medicine as a public service using this expression in its widest sense One might almost say that they cover the evolution of our work from a purely private affair between individuals to one of the vital public services of the community

An Age of Planning

It is some aspects of this evolutionary process that I have chosen to form the subject of my address and to consider once again the relationship between us doctors and the public for it is by those we cure and even more by those we do not cure (so long as they are not dead) that we are ultimately judged It was Mr Bernard Shaw who proclaimed from the mouth of one of his characters that the medical profession was not a profession but a conspiracy though he hastened to add that all professions were a conspiracy against the laity

This is rightly said to be an age of youth but I still think that there is a lot of truth in the old Latin tag Experientia docet I think that I can lay claim to that experience—experience moreover as a working member of the rank and file of the profession The rank and file from their very nature are singularly unvocal For that reason if for no other I welcome the opportunity that your action in making me your President has given one of them to speak publicly on their behalf I have said that this is an age of youth It is also an age of planning *Laisser faire* that principle beloved of our fathers has done great things but it has outlived its time All the signs and symptoms point to the fact that whether we wish it or not in every field of human activity some form of control of planning is necessarily coming We may not like the thought but it is useless to kick against the pricks and it rests largely with us what form that control is going to take

Medicine as an Industry

I want you to look for a moment on medicine as a great industry an industry whose product is the health both physical and mental of the community which it serves I have a moment's hesitation in using this simile as the word industry has come to have a meaning that throws the emphasis on the indirect product—money—rather than on the direct product of the labour involved This emphasis is and I hope always will be, foreign to our own work As I see it this industry is one which is provided with a plant that is excellent efficient and up to date in practically every way I do not think however that the best use is made of this plant It has grown up haphazardly and piecemeal There is great want of correlation great duplication of effort

General Practice

First look at what we may call the selling end of the industry If you want to buy some unusual article you go to a retail shop and make use of their experience with wholesalers and the like to get what you want from the most appropriate source Some such arrangement is necessary in medicine and as things are at present this arrangement is not working smoothly The fault is perhaps largely an administrative one but I believe clear thinking on the exact nature and function of the medical practitioner is also lacking The matter of health and its maintenance is so essentially a personal thing that the personnel of this (retail) division of our health industry must have a close personal relationship with the public as individuals This relationship is only possible in a family doctor either in his present form or in some altered but essentially similar form At present there is a tendency for this branch of the profession to sink

lower and lower in the estimation both of the public and of the student body from which the profession itself is recruited

The practice of medicine itself has been brought into disrepute by the indiscriminate administration of medicines The faith of the public in a bottle of medicine is pathetic I grant it may be used on account of the psychological effect, but often it is quite unnecessary and is only prescribed because the public expect and insist on it On the other hand there is even a section of the public which considers that the training, knowledge, and ability of even the best doctors in the land ought not to be used in helping the sick, that in fact their talents should be hidden in a napkin and reliance placed solely on prayer, and not to do what I believe the Almighty wishes and expects us to do ourselves The principle which I have learned to follow is to avoid drugs if possible, but when necessary to give them in adequate doses—often in much bigger doses than those suggested in the textbooks—until a definite effect is produced I possess a very interesting work on *The Practice of Physick* written by Dr Willan 257 years ago, in which the author recommended all physicians to follow what he invariably did and take a dose himself of every medicine he prescribed for others I imagine this is hardly practicable in these days—especially in the case of panel practitioners in the midst of an influenza epidemic!

A Family Doctor Service

The credit of the general practitioner I have said is sinking A reaction from this attitude is inevitable The more the public is educated and the more the health services extend and intrude into the lives of the people the more will there be required an active and an intelligent family doctor service It will be no corps of clerks It will require a wide professional training to ensure the early recognition of diseased states and the proper co-ordination of the specialist services becoming daily more abundant

A good general education will be essential, also personality and mental agility, so as effectively to inspire confidence and assist in the education of a public which is rapidly becoming more enlightened Again it is in this sphere that the Cinderella of the *medical sciences*, medical psychology, may well come into its own The amount of minor and major functional nervous diseases in the community is admittedly very large The earlier they are recognized and treated the more hopeful is the outlook, and owing to the lack of any obvious disability, except in the later stages it is only the general practitioner who can lead the attack His position as trusted counsellor and family friend lends itself admirably to the purpose and it is true even now that all general practitioners are to a greater or lesser extent psychotherapists They would be much more effectively so if their training included some instructions in the principles of medical psychology This family doctor is the obvious connecting link for our medical industry All direct contact with the public as individuals should be in the first instance through the family doctor There should be no short circuiting or duplication of his services

Specialism

At the back of this family doctor service there must be a specialist service Medicine has grown so enormously that it is quite impossible for any one person to be proficient in every branch The specialist is concerned more with one branch of disease but in these days of specialism when the tendency is to dissever the various organs of the body it is wise to bear in mind the truth of the ancient saying, If one member suffers all the members suffer with it' That great surgeon the late Lord Moynihan is reported to have said that he liked to consider himself a physician who had sometimes to employ surgery to cure some of his cases There is moreover, a lot of mistakenly loose thinking on the subject of specialism The family doctor when all is said and done is also a specialist—a specialist in the recognition of disease in its early stages and in the helping of his fellow men in the many little ills and troubles that beset them, and these may be important, for a serious breakdown in health in later life may have its origin in trifling and unrecognized ailments of twenty to thirty years before To take a case in point The intensive research into the origin and development of cancer points to the probability that malignant growths rarely develop suddenly, but there is a precancerous stage usually lasting for years in which cancer has developed from minor ailments which might often have been rectified if their significance and possible danger were recognized

I would like to see more attention paid to the treatment of the so-called 'minor ailments It has been estimated that 40 per cent of all sickness is due to the patient's own action If this be true (and from my own personal experience I have found it so) think what a vast amount of sickness and ill-health might be avoided, but this requires a willingness on the part of the patient to talk over his minor ailments with his doctor instead of going in for self-medication assisted by the chemist Remember it is the general practitioner who sees the beginning of disease the specialist mainly the end There is no real reason why one branch should be from its nature more eminent than the other They are essentially complementary, and each requires for its proper performance attainments of the highest order

Now in order to get material for practising his art and facilities wherewith to treat them the consultant specialist is inevitably associated with a hospital With the entry of the local authorities into the hospital field things are in a state of chaos in many areas There are strong points in both voluntary and municipal systems and each can learn from the other The one thing that is absolutely essential is the will for exponents of both sides to get together and work out for their own particular areas a scheme that will ensure this co operation of both systems taking the best points of each and not allowing one to swallow the other It is this will to get together that is all too often lacking

Public Health and Co-operation

Apart from the curative specialist services there is another specialist service which is necessary to the modern community—the medical officer of health service or the specialist in social and legislative medicine While the knowledge necessary for this branch is in many ways different from that necessary for the successful practice of individual Medicine, it is dependent on and very closely related to that branch This correlation as things are at present is often extremely deficient, and for any smooth working of the medical services in a community more effective measures of amalgamation must be applied between the two branches I believe that this can be supplied by the provision in each administrative locality of a Medical Advisory Board consisting of representatives of each branch of the medical services—administrative, specialist, and general practitioner Even now in a small

way there are regulations which permit of some such council and in the few neighbourhoods in which it has been tried it has been an unqualified success

Financial Consideration

I have already said that the main emphasis in this industry of ours is rather on the results in the nature of the better health that it brings to its members The real reward to the good doctor must always be the knowledge of having served the cause of humanity Do we not all know how often the cases that give us most satisfaction are those that bring us least money?

The B M A is an Empire wide association of doctors for the advancement and dissemination of knowledge and the maintenance of a high standard of honour in the profession and secondarily for a just and fair remuneration from Government and public bodies This is where the difference is found between the medical profession and a trade In the former the primary motive should be to help the public with profit as a subsidiary factor There are few indeed who could practise so time and soul consuming a work on a purely honorary basis The vast majority of us must depend on our work for the expenses of living and the upbringing of our families

I do not think I am wrong in saying that the whole subject of our remuneration is one that is more and more preoccupying members of every branch of the profession The correspondence columns of our journals and the agenda papers of our Divisions Branches and Committees will bear me out I do not presume to offer a solution for problems the complexity of which has taxed the brains of multitudes much more financially experienced than myself There are however one or two principles which are to my mind fundamental

Free Choice, and Other Principles

The first point which is at the same time the least controversial is what is known as the principle of free choice of doctor You may say that this is hardly a question of remuneration That is true but indirectly it is of enormous importance because its acceptance makes extremely difficult the provision of any sort of salaried family doctor service This I believe must be remunerated on a capitation basis as under the present National Health Insurance system We as an Association have just prepared a revised version of our proposals for a General Medical Service for the Nation, in which the two vital principles of free choice of doctor and of payment on an insurance basis are reaffirmed and their wide extension advocated

The first great extension we propose is the inclusion in the system of all members of all families within an income limit of £250 a year We are seeking to double—no less—the number of individuals who receive medical service through N H I The second extension we propose is that the service given should be medically complete—that is to say that it should include all forms of specialist consultant and auxiliary service as well as that provided by the general practitioner I should not like to say which of these changes can do most for the public health

Such is our official policy far-reaching in scope and well suited to secure the full co ordination of each and all of the country's health services Our proposals would bring three quarters of the community within an official system of medical service Illness is not a steady event from season to season or from year to year and for this reason it lends itself particularly to treatment on an insurance basis Both patient and doctor must surely prefer regular to irregular outgoings and incomings

Within the last six months the Association has been instrumental in forming a National Federation of Provident Associations which extends the insurance method up to a maximum income of £500 according to the number of individuals in the family or to a maximum of £550 in the case of London also taking into account the family income I suggest to you that the principle adopted is one which in the future may well be much more widely applied It is of course the amount of the premium that is the difficulty No man enters the profession of medicine with the idea of making a fortune Equally no man can possibly fulfil the responsible and difficult role for which the family doctor of the future is surely cast without the possibility of sufficient remuneration not only to provide the necessities of life but also the cultural and social activities on which his full usefulness so much depend Any capitation payment must provide this minimum and provide it on a basis of a number of patients per doctor which is not too large to prevent his giving the necessary time to each This time is becoming increasingly more as our knowledge of therapeutic and diagnostic methods increases

Fees for Consultative Work

The remuneration of the consultative branches is subject to rather different conditions Private consultative fees are high relative to those in the other branches The reason for this is that the consultant has a relatively short earning period He has to serve a long and practically unpaid apprenticeship It is hard on him this I would prefer a system where he starts on a fixed salary depended on hospital and clinic appointments carrying a reasonable salary which would vary with their responsibility Were this so the payments for outside consultative work could be considerably lowered and would allow the young consultant while always assured of a livelihood to look forward to an improvement in his circumstances as his repute grew These salaries would come from the funds of the hospitals whether these were supported by the State or by voluntary contributory schemes The days when the hospitals could be regarded as pure charities are gone Very few hospital patients could not afford to join some sort of contributory scheme

Publicity and Education

Let us return a moment to our simile Every industry apart from its productive side always has in addition a public relations or publicity side Hitherto it has always been a keystone of medical policy that publicity or advertising is in direct antithesis to the best interests of the profession and of the public alike The truth of this in regard to advertising by individuals is I think still undisputed I think however that some form of group advertising by the profession as a whole is seriously overdue In fact this publicity side of our industry hitherto neglected could be developed to the benefit both of the industry itself and of the public which it serves Consider a moment this public Taken as individuals and in times of sickness and stress we all know that there can be nothing quite so touching as the almost blind trust which they repose in the science of medicine and in the particular practitioners that happen to be giving them the benefits of that science This is true of the public as sick individuals but the public taken in the mass and in health does not trust either medicine or the medical profession Their attitude is an extraordinary blend of ignorance and

superstition, in which they have unbounded confidence Everybody thinks he knows all about medicine, without training or instruction Test it by telling a group of friends that you have a pain in your hip and at once you have it diagnosed and half a dozen different suggestions of treatment given, all of them 'infallible from carrying a potato in the pocket to wearing a ring of elephant's hair Next day tell the same friends that you have trouble with your neighbour, whose apple tree has blown down across your wall, and as he will not remove it you propose to do so yourself These same friends will at once advise you to do nothing rash, but to consult your lawyer first Thus they think they know medicine, but are not ashamed to admit a complete ignorance of the law

The public want the ailment or disease to be definitely named and then ask why they cannot be cured by such-and-such a treatment which did so much good to their friends What is good for one is good for another,' they say This is where the greatest mistake is made—no two people are exactly the same There is much truth in the old saying One man's meat is another man's poison I remember the case of a man who took five grains of aspirin (a very common and useful remedy) but in this case it was followed in half an hour by acute swelling of the face, tongue and throat, and he was in great danger of suffocation until relieved by the appropriate remedy

Countering Credulity

What opportunity is there at present for the public to outgrow this ignorance and superstition? In the long run I suggest that education of the people must be the basis of any effective remedy I think that this theme of public education in health is particularly apt at the moment The health of the nation is very much in the public eye and unless we guide the enormous enthusiasm that lies behind this campaign there is a real danger that it may do more harm than good I think we should go further than that I think that teaching in elementary biology, anatomy, and physiology should be an essential and important part of all education however elementary Surely it is up to us and to no one else to see that it is included in the curricula of our schools? Similarly, courses of popular lectures could be arranged if not officially, possibly by Branches and Divisions of our own Association I have very little doubt that were they provided there would be no difficulty in finding audiences for them

Secondly, I would suggest that there is a great opportunity awaiting both the Press and the B B C to do more in the educational field Members of the medical profession could do much to help them in that task Surely it should be up to us to see that a supply of well-informed and informing articles is available to whatever papers wish to use them, and equally that the B B C should be given all possible help in the provision of talks which would satisfy these two same conditions? Yet, I do not think that we must expect too much We have to remember that both the Press and the B B C are limited by the educational attainments of those they serve They can help and to some extent anticipate improved education on these matters in the schools They cannot I am afraid take its place That is why I have given first place to education in what I have said

Thirdly, I feel sure that it is only through education of the public that the public credulity in regard to advertised remedies can be removed You all know what I mean when I speak of the evil of patent medicines There are good proprietary medicines as well as bad Some we make use of ourselves, others we could on no account condone or recommend What matters is that because of the superstitious ignorance of the public there has grown up an enormous mass of advertisement literature for remedies that are framed to cure not only every disease known to the profession but also many diseases invented purely for the sake of being cured by some particular remedy It may be true that many of these remedies are in themselves quite harmless or even beneficial when properly used That is not the point The advertisement is designed to create a demand, and the demand can only lie in ill-health, imagined or real, or (more insidiously) by the suggestion that a certain product is necessary for the maintenance of health These advertisers know their job Their writings are carefully couched in pseudo scientific terms and we see daily in our practices how enormously receptive and almost universal is their audience It may be unreasonable to criticize unduly those who for their own profit play the tune which the public wants As I have said by no means all of these advertised remedies are intrinsically undesirable It must be in the interests of the reputable manufacturers that the demand for their products should be based on sound knowledge and not on ignorance and fear For the rest, the trade as it is now conducted could only flourish in a public which knows little or nothing of the true principles of health and healing The schools can educate the public and we as a profession can tell the public The more the public trusts us the more we are able to help and the sooner they will believe that we are truly endeavouring to protect them against themselves It is by measures such as these and not by restrictive legislation that the true cure of the evils which I have mentioned will come

Medicine in the World of Science

I believe further that there is another sphere of education in which our entry might be of incalculable value I like to believe, and in doing so I do not think I am entirely governed by prejudice, that the scientific world is a whole is to a large extent free from most of the jealousies which poison the interrelation of humanity in the world to-day Scientists as a body approach nearer to the ideal world community than any other large division of mankind Who has ever heard of class-warfare between workers in any field of science or of an embargo on the exchange of knowledge, whether intra- or international? Even when something of the latter kind has been imposed from some political sphere it has been met with prolonged and emphatic protests from the entire scientific world The medical profession forms one of the most important divisions both numerically and influentially of the world of science The profession as a whole is really working for the common good of the community and not with the idea of screwing the last penny out of them It is a true brotherhood, and in ordinary practice the individual doctors continually assist one another and pool their knowledge and advice to an extent quite unknown to the patient and the public at large, but it is also unique in that world because of its close relationship with the lives of the non-scientific laity Are we not, then, in an ideal position to bring the ways of life and thought of one world to the benefit of the other?

I do not presume to dictate a programme, but I humbly suggest that there are possibilities in the idea that at least merit our consideration both as individuals and as an organized profession I would like to suggest that as members of this great profession we have possibly an important missionary function in this cause

TREATMENT OF CARCINOMA IN THE PHARYNX AND LARYNX AND ITS RESULTS*

BY

LIONEL COLLEDGE, F.R.C.S.

Surgeon, Ear and Throat Department, St. George's Hospital

The introduction of irradiation has rendered the problem of treatment in various situations infinitely more complicated because the results of its use are neither so good that the method can claim to supplant simple surgical treatment altogether nor so bad that they can be dismissed as negligible. In certain situations other than the pharynx and larynx the matter is much simpler; for example, in the floor of the mouth irradiation has taken the place of surgery almost entirely, whilst in the stomach the abdominal surgeon does not need to concern himself with it. Unfortunately it is also true that in many situations such as the oesophagus where the results of surgery are bad those of irradiation also are poor and conversely many of the best results obtained by irradiation are in situations where the tumour is most amenable to surgery. This applies to the larynx and pharynx. If surgical treatment is chosen then an operation suited to the site and extent of the tumour must be designed; if irradiation is chosen, then the type of radiation and the method of its application must be settled.

It is proposed to deal first with tumours in the oropharynx—that is tumours of the tonsil and fauces—and then to deal rather more fully with the lower pharynx—that is, the laryngopharynx and the larynx itself. My own endeavour will be chiefly to indicate what can be expected from surgery, and I will leave it to others to show the best that can be obtained by irradiation. A great variety of tumours may be encountered in the situations under consideration but I think that this discussion will have more value if it is limited to epithelioma which is the common form of malignant tumour.

In the oropharynx epithelioma usually begins either on the lower part of the anterior pillar or in the angle between the lower pole of the tonsil and the side of the tongue and is usually seen spreading over the tonsil and fauces and into the side of the tongue. There may or may not be a palpable gland in the neck; often there is, not but if the cervical glands are enlarged the size is often in inverse proportion to that of the primary growth.

Where the growth is comparatively early without fixation and there are no palpably enlarged glands in the neck the tumour may be removed by diathermy as Norman Patterson has long advocated. Such cases must be kept under observation lest enlarged glands appear in the neck. If a gland dissection has to be combined with removal of the primary tumour it should precede the diathermy operation by ten or fourteen days to avoid difficulties from the changes which diathermy produces in the neck. Patterson records that out of fifty patients treated by diathermy nine died and thirteen survived for more than three years.

In more advanced infiltrating growths where the tongue is more invaded or the growth has become adherent to the inner surface of the mandible diathermy is not applicable alone and the operation required includes removal of the mandible from the canine fossa to the condyle. This is naturally a mutilating operation and must be followed by a careful reconstruction. Dickie records that in thirty cases so treated there were seven deaths and fifteen recurrences in less than five years but eight patients survived for more than five years and one for over eleven years. Radiation employed in such cases may take the form either of radium applied at a distance or of the implantation of radon seeds.

The treatment by irradiation is most attractive because when successful the pharynx is almost normal in appearance but the question remains whether in treating epithelioma it gives a sufficiently high proportion of lasting good results to displace surgery. Biopsy must take an important place in making this decision because sarcoma and Group IV epithelioma which in its clinical course may be said to have more affinity to sarcoma than to keratinized epithelioma give uniformly bad results with surgery and are radiosensitive.

In the lower pharynx the growths to be considered are those on the lateral wall of the pharynx, the epiglottis, the arvepiglottic folds, the fossa pyriformis and the post cricoid area. Of these various types the growths on the lateral wall of the pharynx, the epiglottis, the arvepiglottic fold and in the post cricoid area may be treated by lateral pharyngotomy combined with a subsequent plastic operation if in an early stage. For these tumours in a more advanced stage and for tumours of the fossa pyriformis almost always operation must be a pharyngolaryngectomy. That operation includes clearance of the glands on at least one side of the neck and removal of the whole larynx and either a portion or a complete segment of the pharynx. A somewhat elaborate plastic operation is required later to reconstruct the pharynx, the patient being left with a laryngectomy.

The classification of cases in these groups into those suitable for lateral pharyngotomy or for pharyngolaryngectomy and those which are inoperable must be decided by clinical experience which takes into account the extent of the primary growth, the invasion and degree of fixation of lymphatic glands and the general condition of the patient.

Gluck and Soerensen record fifty-eight operations by subhyoid pharyngotomy, but this method is applicable only to carcinoma of the epiglottis. In 334 cases of extrinsic cancer treated by laryngectomy combined with resection of the pharynx with seventy-seven deaths they obtained a permanently good result in 10 per cent. In Gluck's clinic patients whenever possible were submitted to operation so that no attempt was made to make the statistics appear favourable by selection of cases. Of my own patients treated by pharyngotomy or pharyngolaryngectomy between 1920 and the beginning of 1935 the following are some particulars:

TABLE I

	No.	Died	Recurrence	Remain Well
Pharyngotomy: Private patients	13	0	-	6
Hospital	26	9	10	7
Total	39	9	17	13
Pharyngolaryngectomy: Private patients	7	1	4	2
Hospital	9	2	3	4
Total	16	3	7	6

* Read in opening a discussion in the Section of Oto-rhino-laryngology at the Annual Meeting of the British Medical Association, Plymouth, 1938.

Of these cases five of pharyngotomy and two of pharyngolaryngectomy have remained well for more than eight years That is, out of fifty-five operations nineteen were successful, or 29 per cent Against this must be taken into account that some cases have to be rejected as inoperable and that some of the operations are of a mutilating character, but, again, the operation has succeeded in some cases after the failure of radiation

On the other hand, at any rate until recent years, the results obtained by treatment with x rays or radium in this class of lower pharyngeal or extrinsic laryngeal tumour were almost negligible and the condition of many patients was aggravated It is in this class of case, in which the operations are particularly difficult and require ceaseless care and patience in the subsequent management, that an alternative treatment by *x* rays or radium would be welcome if a reasonable percentage of successful results can be obtained

In the group of intrinsic cancers of the larynx, including tumours of the vocal cords—a few being on the ventricular bands or having origin in the ventricle, and some being of subglottic origin—the operative treatment is either by laryngo-fissure (with which partial laryngectomy may be included) or by total laryngectomy The position and extent of the growth here again determine whether simple removal of a vocal cord on one side is done, or whether the front of the larynx or the whole larynx has to be removed

Gluck and Soerensen record, for intrinsic cancer, 141 cases of laryngo-fissure with nine deaths from the operation and ten recurrences, 122 patients remaining well for at least three years They also record 501 cases of total laryngectomy for intrinsic cancer This number includes a series of 100 with two deaths, and in the last 181 cases there were twelve deaths from the operation During the last ten years there were 30 per cent of lasting good results

The following are particulars of operations on my own cases of intrinsic cancer

TABLE II

	No	Died	Recurrence or Untraced	Remain Well
Laryngo fissure or partial laryngectomy				
Private patients	16	1	1	14
Hospital	7	1	2	4
Total	23	2	3	18
Total laryngectomy				
Private patients	42	2	9	31
Hospital	33	12	7	14
Total	75	14	16	45

Of these cases nine of laryngo-fissure and eighteen of laryngectomy have remained well for more than eight years, including three for more than fifteen years

In this group, out of ninety-eight operations seventy-three were successful—that is, 74 per cent Here, again, some of the operations are of a mutilating character, but in early cases where only a vocal cord is removed the voice is often normal and much better than after treatment by radium This group also includes patients in whom the cartilages had been attacked by growth or in whom perichondritis had supervened, rendering them unsuitable for treatment by radiation

It is in this group that irradiation has had most success, and therefore that line of treatment is the most attractive, but it has to be shown that it can produce a large percentage of good results I suggest that if radiation be employed it should be in the form of the radium beam, and that needles should no longer be used

The figures for the operations have been given separately for the private and hospital patients because, although the numbers of each are approximately equal, the results in private practice are very much superior owing to the better condition, both general and dental, of the patients, the segregation of the patients in private rooms, the avoidance of changes in nursing staff, and the constant personal supervision of the surgeon

In introducing this discussion I wish to avoid undue emphasis upon any particular method of treatment This is particularly dangerous in discussing malignant disease, because in practice individual cases have to be considered, and, whatever the treatment, the prognosis of any one case is always doubtful, however favourable it may appear on the one hand or unfavourable, short of being quite hopeless, on the other There is therefore, when failure ensues, often a feeling of regret that different treatment was not instituted, especially when irradiation fails to cure an operable case Operation, too, might have failed, and I am concerned only to bring forward some points in the hope that the ensuing discussion may help to clarify the position

I have to thank Mr Arthur Pereira registrar at St George's Hospital, for his help in following up the fate of the patients and in preparing the statistical tables

THE DIAGNOSIS OF UNDESCENDED TESTICLE

BY

DENIS BROWNE, F.R.C.S

Surgeon to the Hospital for Sick Children Great Ormond Street London

There are few conditions upon which more contradictory diagnosis and advice can be obtained from the medical profession than those which fall into the vague and elastic category of "undescended testicle" I know a parent who was told that her son's testicles

(*a*) Needed immediate operation if he were not to be practically a eunuch (A surgeon of great experience)

(*b*) Should be left for five years to see what happened (Another reputable surgeon)

(*c*) Should be treated by hormone injections (A physician)

(*d*) Should on no account be operated upon as the operation invariably failed (The family general practitioner)

(*e*) Were normal (Myself)

(*f*) Were held up owing to a displaced vertebra (An osteopath)

It is hardly necessary to say that the last diagnosis and the treatment that followed are now held responsible for the present obviously satisfactory condition of affairs Admittedly this is an extreme case, but others like it are only too common

When I first began to see numbers of these cases I was continually in doubt as to what advice to give, but latterly they appear to me to belong to certain well-defined groups It may be of interest to put forward my present classification I am far from thinking it a final one, but it is certainly much better than anything I had to start with One of my difficulties was that the testicle in almost all its varied positions is extremely mobile, so

that it can only be properly charted as somewhere on a range of movement between two points I have tried describing the variations by the names of these points but the result was so clumsy that I have been forced to coin names for them

Misconceptions

Most of the confusion is due to three widely held misconceptions upon elementary points

1 *The Failure to Recognize the Normal Variations in Positions of the Developing Testis* I believe that any position in childhood from which the testicle will in

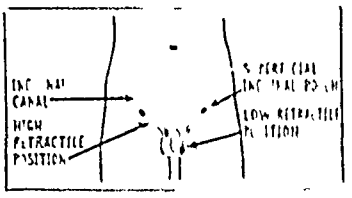

FIG 1—This is the diagram which I use for recording the positions of testicles It shows by conventionalized signs the inguinal canal and the superficial inguinal pouch The position of the testis is charted by a black oval at each end of the range of movement connected by a fine line

variably reach the scrotum should be classed as normal The custom at present is to describe as undescended any testis that is not in the position which would be normal for an adult

2 *The Idea that a Testicle which can be Felt in the Deep Tissues in the Region of the Inguinal Canal Is Actually in that Canal* In the young child the testis frequently disappears upwards out of the scrotum It is almost universally assumed that it goes into the inguinal canal It does not It runs into a space between the fascia of Scarpa and the external oblique muscle which is filled with the loosest of areolar tissue and bounded at whence it slips easily into the canal If this disposal is thought too geometrical, it is possible to try the direct experiment of endeavouring to thrust the testicle up into the intact canal during, for instance, a hernia operation Leckie (1904), again, speaks of trying to push down a testicle that is in the inguinal canal by manipulations from outside

It seems impossible that such a notion should exist so long I can only point to the way in which surgeons have confidently operated for generations upon a demonstrably very inaccurate classification of the anatomy of the whole region involved (Browne 1933)

A testis that is in the inguinal canal cannot be felt through the skin It is a soft elongated sausage-like object sunk in the soft floor of the canal hold it from touch by the tense tendon of the external oblique In consequence I find it difficult to take very seriously the long lists of cases in which testicle described as found before treatment in the inguinal canal, have descended into the scrotum after treatment by manipulation

3 *The Classing of the Commonest Varieties of Ectopic Testis as Undescended* This is that variety of ectopia well recognized by certain writers as the migrated inguinal Barrington Ward (1927) described only and drew the important distinction between operation upon the and operation upon the testis Unfortunately the term universal in almost every of cases for undescended is the term the cryptorchid testis is the is the commonest the gland tumbles over the the stimulus the pubic in which testis not think that a testis may through the stimulus of unfortunately the hindrance of descent

Variation in the Position of the Testis

It has yet should position which

birth, and there is never any question of the correctness of their position

(B) *Low Retractile*—In this common variety the lower limit of the range of movement is the same as in the adult—the bottom of the scrotum But the testis is so light and small, and the cremaster so active, that it is often pulled up over the bar of the pubic bone Once over this it runs freely into the superficial inguinal pouch, and may stay there for days, though it can always be forced down with the fingers

Diagnosis—It is often diagnosed as undescended testicle"

Treatment—I have known these patients given injections of pregnyl with excellent results I hope they are never operated upon Needless to say they only need leaving alone

(C) *High Retractile*—In these the testis remains habitually running freely in the superficial inguinal pouch, and does not spontaneously descend thence during childhood It can, however, be pushed down well below the external ring, over the pubic bone, and into the neck of the scrotum This lower range of movement is the very important distinction between it and the superficial inguinal ectopic position

Diagnosis—It is almost invariably diagnosed as "undescended testicle'

Treatment—I believe that this class supplies the greater number of the successes of pregnyl treatment, which undoubtedly in many cases does enlarge the size of the gland and hurry its descent A considerable number are operated upon, usually with good results

In my experience in these cases descent invariably occurs spontaneously when the testicle begins to enlarge to the adult size and weight I have never seen or heard of an adult testicle with this range of movement Certain cases for which I advised operation, and which to my confusion developed normally without it, undoubtedly belonged to this category They are also the justification of the policy of waiting to see what happens, and account for 'undescended testis" being about three times as common in children as it is in adults

2 UNDESCENDED POSITIONS

(A) *Emergent Inguinal*—In this position the testicle can be felt popping in and out of the external ring, moving freely in the hernial sac that invariably exists, much as an ovary often behaves in an infant of the opposite sex It should be noted that the testis only emerges or withdraws according to the mechanical forces acting upon it, such as increased abdominal pressure in one direction or the surgeon's finger in the other It is never pulled in by a contraction of the cremaster, which is always very poorly developed in these cases

Diagnosis—This may be as difficult as that of a small inguinal hernia the testis may be easy to feel one day and impossible the next This is fortunately of no great importance as the treatment is the same as that of the conditions with which this variety may be confused

Prognosis—I am not sure what would be the fate of a testis of this sort if left untouched till adult life, as I have never felt it justifiable to do so If bowel descends into the hernial sac it would probably drag the testis down into the scrotum with it Apart from this, as the enlargement of puberty caused the testis to become a tighter and tighter fit in the external ring it would finally be shut out permanently, as the forces which drive it out are so much stronger than those which draw it in Probably it would end up in the superficial inguinal pouch rather than make its way into the atrophic scrotum which is usually present in these cases It is impossible to say that these testes never descend either spontaneously or after the administration of pregnyl but I have never seen one do so

Treatment—In every case operation, at which the coexisting hernial sac is removed

(B) *Middle Inguinal*—These testicles run in a hernial sac from one end of the inguinal canal to the other They are invariably badly developed, soft, and elongated to fit the space in which they lie It is curious to see how they change into the normal compact rounded shape if they are successfully shifted into the scrotum

Diagnosis—The main point is that it is impossible to diagnose this position without operation, since, as has been said, it is impossible to feel a testis in the inguinal canal Consequently till the canal is opened one cannot say whether the testis is in it, in the abdominal cavity, or is absent altogether

Prognosis—I believe that these testes never descend spontaneously or as a result of hormone treatment Descent of bowel into the hernial sac would probably bring one down

Treatment—Operation in every case

(C) *Entrant Inguinal*—The testis varies in position between the upper end of the inguinal canal and the abdominal cavity Its only important point of distinction from the preceding class is the greater difficulty of bringing it down at operation

(D) *Abdominal*—Here the main point of interest is whether, if one does not find a testicle in the inguinal canal, one is justified in opening the abdomen to search for it

3 ECTOPIC POSITIONS

(A) *Superficial Inguinal*—In this position the testis lies in the lower part of the superficial inguinal pouch, free to move up in it to an extent determined by the length of its cord To arrive there it has turned sharply upwards and outwards on leaving the external ring, apparently because of an abnormal attachment of the fascia of Scarpa to the pubic bone This means that instead of the inguinal pouch having an open lower end, the way from it into the scrotum is blocked by a strong fibrous hammock, in which the testis lies supported As I have said, some surgeons recognize this common position as an ectopia, but many do not Ombredanne (1932) does not figure it in his diagram of the directions in which ectopia may occur, and McAdam Eccles shows several examples of it in his classic work as inguinal retention and not as ectopia A point of interest is that if a large hernia develops in this position it will descend into the inguino-crural fold, not into the scrotum

Diagnosis—The most important single point in the diagnosis of testicular position is the distinction between this displacement and the high retractile testis One needs operation and one does not One responds to pregnyl and one does not One develops normally if left alone and one does not

Prognosis—There is no possibility of spontaneous descent

Treatment—I have known vast amounts of pregnyl employed in attacks upon this variety, with no result whatever on the position It is the one which accounts for the fact, still being confirmed, that cases of unilateral undescended testis average much poorer results with hormone treatment than bilateral ones Incidentally I would have thought that if one testis had descended normally it might be assumed that whatever was keeping up the other, it could not be lack of hormones However, I have never had this objection taken seriously as a reason against giving a course The only treatment is operation It is easier than in a true undescended testicle, owing to the extra length of cord

(B) *Emergent Superficial Inguinal Ectopic*—The distinction between this and the emergent inguinal position is merely a fine shade of diagnosis In everything else they are alike

(C) *Other Ectopic Positions*—The penile, femoral, perineal, and other well-recognized positions present no diffi

culties in diagnosis As a curiosity I may mention being called to operate upon what was diagnosed as an acute appendix Actually it was a torsion of a testicle between the two oblique muscles over McBurney's point

Summary

To recapitulate some of the points which have been put forward

1 A testicle that is in the inguinal canal cannot be felt through the skin Conversely a testicle that can be felt is not in the inguinal canal

2 The testis is never withdrawn into the inguinal canal by the cremaster

3 When the testis ascends from the scrotum it runs into a somewhat similar pouch above external to the abdominal muscles

4 A testis that can be easily seen through the skin anywhere except in the scrotum is ectopic

5 A testis that can be pushed down over the pubic bone will invariably descend spontaneously by the time full growth is reached

6 Prenatal treatment will not bring down any testis that would not have descended without it though it will hurry the descent Whether this acceleration is worth the risk of certain disquieting possibilities is a matter of opinion

MEASLES

THE CONDUCT OF A SCHOOL EPIDEMIC

BY

T G HOBSON, D S O, D M, F R C P

Honorary Physician to the Radcliffe Infirmary and County Hospital Oxford

What should be the course and outcome of an epidemic of measles in a school community? The answer to such a question must depend upon a number of considerations —clinical seasonal domestic and economic—and yet each medical officer of a school community must have before him an ideal that it will be his endeavour to realize when faced with the inevitable and recurrent onslaught of measles in the community for which he is responsible

Agreement is still incomplete upon the elementary data (Hobson 1934) which may conveniently be stated as under

1 Measles is due to a virus—as yet unidentified—and a *natural* attack of the disease is generally regarded as conferring a permanent immunity Second and third attacks of the disease are well known to occur but are so rare that they can safely be ignored within the age limits of school life It is frequently stated and generally assumed that an attack of measles *attenuated* by the administration of immune serum confers an immunity as permanent as that which results from a natural attack This reasonable assumption may prove to be well founded but as yet it rests upon no solid body of clinical evidence

2 Infection is by droplets from the nasopharyngeal excretions of infected individuals and a patient may be infectious six days before the appearance of a rash (Hobson 1934) The catarrhal discharges of the infected may also be the vectors of secondary virulent organisms to other susceptibles

3 The incubation period is more than ten days and in serum treated cases may be twenty one days In serum treated cases there may be no clinical evidence of infection before the explosive appearance of a rash on the twenty first day (Hobson 1934)

4 Quarantine should be observed for twenty one days in all cases

Measles vies with influenza and whooping-cough as the most infectious disease in a closed or semi-closed community such as a school and the prospects of limiting the spread of the disease by early diagnosis and segregation of infected individuals are very small indeed Koplik's spots appear too late and too inconstantly to be of any real value in early diagnosis and may be recognizable only with the appearance of the rash in serum treated cases

The First Principle

If these data be accepted the first principle in conducting a school epidemic will be that the epidemic shall be allowed to take its course and that the susceptibles who succumb shall experience a natural attack of the disease in the maximum *security* thereby acquiring a permanent immunity This principle requires amplification

1 *Susceptibles*—In each school there will be a small number of delicate susceptibles for whom an attack of measles will entail an unusual risk particularly in the case of those children who are liable to otorhinological or pulmonary diseases For these cases which should be selected by the school medical officer serum prophylaxis is clearly indicated For a few specially delicate susceptibles the dose should be one that will ensure *protection*—such children should then be removed from school to avoid further exposure to infection on a falling tide of passive immunity For the majority of such delicate susceptibles the dose of serum (see later) should be so timed and adjusted as to secure *attenuation* of the attack and these protected susceptibles should be allowed to continue with normal school routine The routine use of convalescent serum for all susceptibles is not recommended until the time comes when serum therapy has a scientific posology and it has been established that the immunity from an *attenuated* attack is as permanent as that which results from a natural attack of the disease The deliberate postponement of an attack of the disease by *protecting* all susceptibles cannot be considered as wise although special circumstances may justify such a practice (Hobson 1934) Such special circumstances must be judged by the medical officer concerned but a coincident epidemic due to *S pyogenes* or *H pertussis* might be mentioned as a circumstance such as would justify an attempt at *mass protection* or *mass attenuation*

2 *Security*—The complications of measles present the real danger to health and life such complications arising from secondary infection by pyogenic cocci particularly from *S pyogenes* Complications may derive from an intrinsic or extrinsic source of infection they come far more frequently from the latter *Complications are most usually secondary infectious diseases* arising from cross infection by neighbours nurses or doctors (Okell and Elliott 1936 Keevil and Camps 1937) Security from cross infection can be attained only by strictly observing the established rules of environmental hygiene and nursing which are familiar to the profession in treating all highly infectious diseases The measures so indicated can be briefly summarized under the headings of

Bed Spacing—A minimum of six feet should be preserved *between the edges of adjacent beds* in well ventilated sick rooms or alternatively effective barrier nursing. (Where cubicles are available no difficulty arises.)

Masking—Nurses and doctors should invariably wear masks when in close contact with the patients *

Sterilization—All table-ware, cutlery, etc, used by the patients should be sterilized after each meal

Personal linen towels etc must be so supplied as to avoid common use or exchange, while paper handkerchiefs, which can be destroyed, should be employed for all nasopharyngeal discharges

The fact that those who succumb are suffering from the *same disease* must never be used as an argument for the relaxation of any of these accepted rules

The self-contained preparatory boarding school is an ideal community for epidemiological study, in that its inmates are usually housed in one building, have minimal opportunities for contact with the outer world, and have become "salted" to their indigenous flora The school environment, "the stage" on which an epidemic may be set, is a fixture that must be adapted to the requirements of an epidemic, and in this process of adaptation and in the strict conduct of environmental hygiene in the sick-rooms the personal ingenuity and industry of the medical officer have full play (Dudley, 1926 Glover *et al*, 1932) No step should be omitted to ensure that the child shall sustain the attack of an epidemic disease in conditions of safety comparable to the isolation of an independent sick-room in the family home

The power of the responsible medical officer to order the conduct of an epidemic is, however, subject to those limitations which may be imposed by parental acceptance or refusal of a proposed course of action Any course which involves the use of a therapeutic agent other than the traditional bottle of medicine, or entails a specific extra charge, is in practice referred for parental consent even when the action or dilatoriness of a few individuals may prejudice or frustrate a plan of action designed to safeguard the interests of a community as a whole

In relation to any new prophylactic or therapeutic practice the measure of the average parent's knowledge is uncertain, and opinions may therefore be influenced by prejudice, ignorance, and anxiety For these reasons a clear statement of the relevant facts should be sent to all parents without delay, with the usual notice of the appearance of the initial case, since the prophylactic administration of serum for protection or attenuation must be prompt if it is to be effective The form of this statement is of some importance, and the following is suggested as likely to secure the co-operation of parents, although it will be obvious that no attempt has been made to distinguish between *protection* and *attenuation*— a distinction difficult to make intelligible to the layman and impossible to ensure in practice

QUARANTINE NOTICE

"A case of measles developed on and it must be anticipated that further cases will occur

'By the injection of human serum (from persons who have themselves had measles) it is possible *temporarily* to protect an exposed susceptible individual from the disease with very reasonable prospects of success

The immunity conferred is only temporary, and the child becomes again susceptible to the disease in from six to twelve weeks time the duration of this temporary immunity is always a matter of doubt

This practice merely postpones an attack to a later age The normal expectation is that one attack of measles confers a permanent immunity and will be well sustained by the vast majority of children

'In view of the fact that reliable protective serum is only available in very limited quantities it is suggested that any child who may be considered delicate or for whom an attack of measles may entail some special risk shall be *protected* by an injection of serum

'It is suggested that in the case of children who are in good health events should be allowed to take their normal course"

Signed

For "delicate susceptibles" a footnote is added

"It is recommended that your child be given an injection of serum It is impossible to ensure complete protection but this treatment can be expected to mitigate the severity of an attack"

For specially selected "delicate susceptibles"

"It is recommended that your child be given an injection of serum at once and taken home until the school is out of quarantine'

Serum Prophylaxis

Since Gunn (1928) introduced prophylactic serum therapy into this country there has accumulated a considerable body of evidence as to its value (L C C Measles Epidemic 1931–2, 1933–4, Gunn, 1938) The use of serum prophylaxis calls for judgment and discretion, and it may be helpful to give a brief summary of the known facts

Three preparations are available

A *Convalescent Serum*—Obtained from individuals who have recently recovered from an attack of measles There is at present no uniformity in the practice of collecting such serum (In the Oxford service an arbitrary limit has been employed—namely, that such serum should be collected within one month of the rash of the donor)

B *Adult Serum*—From adults who have experienced an attack of measles (In Oxford an arbitrary limit of ten years from the attack of measles is observed)

C *Immune Globulin* (Lederle)—This is the pooled globulin obtained from human placentas

It is well to recognize the comparative and common merits and defects of these three preparations, the powers and dosage of which are often stated with a precision which is not justified by the known facts Until such time as it is possible to determine the antibody content of a given preparation the posology must be empirical The practice of pooling will favour an approximation to a standard potency, and the efficiency of the three preparations is likely to be in the order given The rate of deterioration of the antibody content of serum is unknown, and in this respect the immune globulin may have an advantageous quality All three preparations, when administered in adequate dosage prior to the "critical day,' can undoubtedly exercise a favourable influence upon the course of an attack of measles It is probable that the 'critical day'—that day of the incubation of the disease after which no protective therapy can influence its course—is the sixth day after exposure calculated from the first appearance of the rash of the infecting case (L C C Measles Epidemic, 1931–2) By this time the disease may have been incubating in the susceptible individual for six to ten days *

* The Miskon celluloid mask supplied by Down Bros, is an efficient and convenient type

* Gunn (1938) in a review of the clinical results of serum prophylaxis of measles in L C C hospitals fails to make clear the basis of calculation in arriving at the *date of exposure* As in the previous L C C reports (1931–2 1933–4) this point has never been clarified The date of the appearance of the rash of the infecting case must in practice be the clinical event about which there can be no argument or doubt A given case may have been infectious for one to five days before the appearance of the rash and the *earliest* day of infectivity can rarely be determined on clinical evidence The practice of serum prophylaxis will be less confused if the *date of exposure* is the date of the appearance of the rash of the infecting case

Protection.—Where complete protection is desired the maximum dose should be given at the earliest moment after exposure later than the third day after the rash of the infecting case the prospects of success are small A protective dose confers no more than a temporary passive immunity

Attenuation can be achieved by two methods (*a*) the early injection of a submaximal dose—that is before the third day (*b*) the injection of a maximum dose late in the incubation period (L C C Measles Epidemic 1931–2)—that is on the sixth day This latter method has in my experience proved to be the more satisfactory and for obvious administrative reasons (obtaining parental consent etc) the more practicable

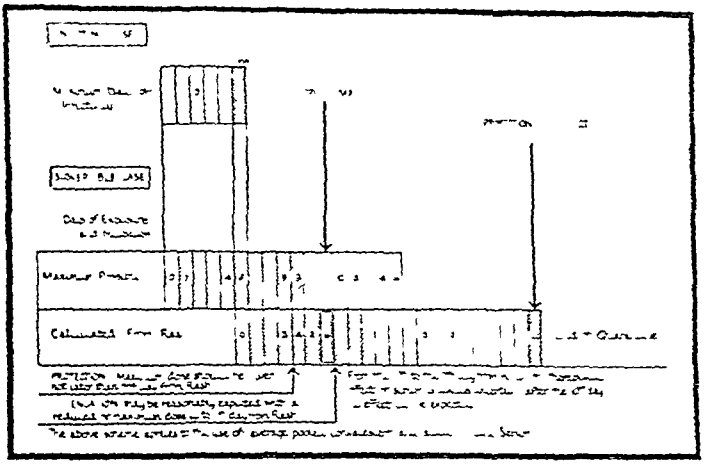

FIG 1.—Scheme of protective therapy (Reproduced by courtesy of Oxford University Press)

An Epidemic in a Preparatory School

The epidemic now to be described developed in characteristic fashion from a single case in the first week of the Lent term 1938 in a school of ninety five boys This school experienced a previous epidemic in 1929 (School A Fig 2 Table II)

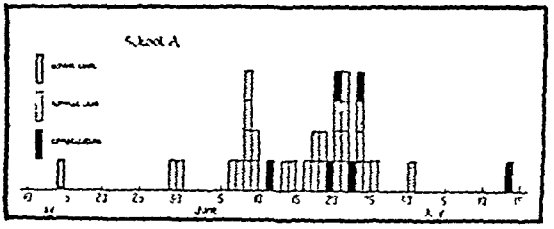

FIG 2.—Measles in School A in 1929

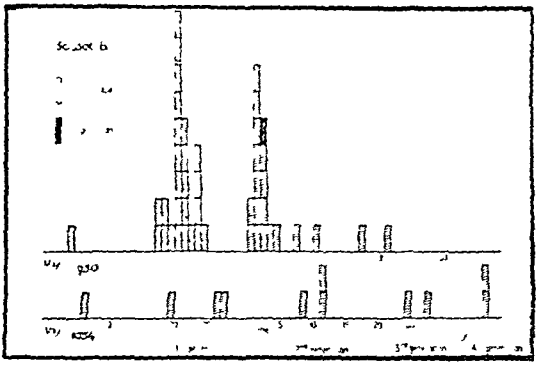

FIG 3.—Measles in School B in 1930 and 1934

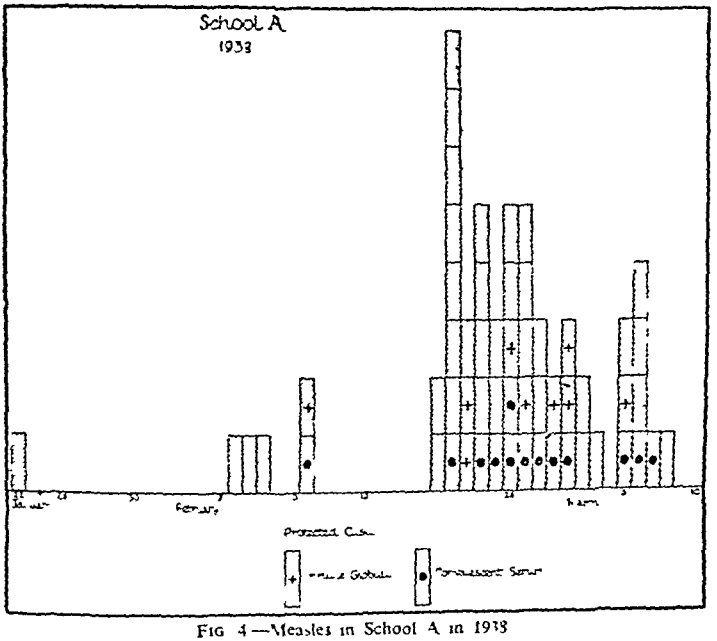

FIG 4.—Measles in School A in 1938

There were fifty six susceptibles In view of the fact that there was no intercurrent infection in the school or any other special circumstance which might expose those attacked to any undue risk it was decided

1 To attenuate the attack in all known *delicate susceptibles* with (C S) convalescent measles serum (10 c cm) on the sixth day after exposure to the initial case Delicate susceptibles were those children who had suffered from known pulmonary or oto rhinological disease in the previous year or who had an unsatisfactory previous medical history Thirteen such cases were selected and *the parents were notified of this proposed protective therapy*" all agreed to its employment

2 To allow the epidemic to follow its natural course in the remaining forty three cases Parents of these children received a notification of the appearance of measles in the school with a recommendation against protection (see letter given above) The parents of nine children insisted upon serum therapy and in each case the child received (I G) immune globulin (10 c cm) (£2 2s) on the *sixth* and *seventh* days after exposure to the initial case

No specific therapy was employed for the remaining thirty-four boys

3 The environmental hygiene and nursing precautions described earlier in the paper were rigidly observed

The results of conducting the epidemic on the above principles and the clinical data so provided may conveniently be summarized under separate headings

General Results

1 *No complication of any kind occurred in the fifty-six cases attacked*

2 *All of the C S-protected and I G-protected cases showed attenuated attacks* (Fig 4, Table V)

Morning and evening temperatures were taken from the first day of term until the completion of the epidemic, and any boy showing a temperature of over 99 5° was isolated for observation Every child who showed any febrile disturbance was inspected daily

Prodromal Fever—The prodromal fever was appreciably shortened in the protected cases In two cases the rash appeared on the twenty-first day after exposure to the initial case without any prodromal fever or the appearance of any Koplik's spots (One case C S, one case I G)

Koplik s Spots—Even in the unprotected the appearance of this characteristic lesion is so late as to be useless as an *early* diagnostic sign, six of thirty-two unprotected cases showed no Koplik s spots before the rash, this applied to eleven of twenty-two protected cases

TABLE I

	No	Average Days Prodromal Fever	Average Days Koplik s Spots	No
Unprotected	32*	2 6	1 0	
Protected	22	1 8	0 5	
		Actual Days	Actual Days	
Unprotected	32			
Maximum	10	4 0	4 0	1
Minimum	7	1 0	0	6
Protected	22			
Maximum	2	4 0	2 0	3
Minimum	3	0	0	11

* Two boys of the original thirty four unprotected cases were taken home on the appearance of the initial fever

Protection (that is, attenuation) was secured by the administration of (C S) convalescent serum 10 c cm (thirteen cases) and (I G) immune globulin 10 c cm (nine cases),* which was injected on the sixth day—the "critical day With one exception—a patient who had been given only 4 c cm of immune globulin by his family doctor—the attack of measles was definitely attenuated as regards both severity and the height and duration of the febrile reaction Two C S cases had aborted attacks—that is a minimal febrile reaction (99 5° to 100°) for three days and a transitory rash

The convalescent measles serum was obtained from the medical officer of health for Oxford, and was "pooled" serum the evidence suggests that this was less potent than the convalescent serum employed in School B, 1934, and the larger dose was given on this assumption (Fig 3, Table IV)

* The claim that immune globulin modifies an attack of measles is sustained but as the author was sceptical of the claims of this preparation 10 c cm was employed although the makers recommend no more than 2 c cm The single case which received a small dose showed *no attenuation*

Previous experience with measles epidemics can be graphically demonstrated and the lessons learned emphasized

TABLE II—*School A (1929) Thirty-six Susceptibles*

	No	Measles	Escaped
Unprotected	36	36	0
Protected	0	0	0
Total	36	36	0

100 per cent infected, none escaped 6 complications (otitis media, 3 cases, bronchopneumonia and otitis media 3 cases)

Lesson—The high incidence of complications was attributed to overcrowding, inadequate bed-spacing, and failure to observe a strict environmental hygiene

TABLE III—*School B (1930) Sixty eight Susceptibles*

	No	Measles	Escaped
Unprotected	65	46	19
Protected	3	2	1
Total	68	48	20

70 per cent infected, 30 per cent escaped, 1 complication, 2 protected children who developed measles had modified attacks

Lesson—Strict observance of environmental hygiene and a very limited use of convalescent serum proved eminently satisfactory

TABLE IV—*School B (1934) Fifty one Susceptibles*

	No	Measles	Escaped
Unprotected	2	0	2
Protected	49	10	39
Total	51	11*	41

20 per cent infected, 80 per cent escaped, no complications 10 protected children developed measles and 6 of them had modified attacks

Lesson—An extensive use of convalescent serum to produce a mass "attenuation" produced an almost complete mass "protection '

During the previous term whooping-cough and a widespread nasopharyngeal epidemic due to *S pyogenes* suggested the wisdom of such an attempt to mitigate the severity of measles in a population which might contain numerous carriers of virulent streptococci The convalescent serum employed for this purpose was obviously of a very high potency (the bulk having been obtained from two recently recovered adults), as shown by the fact that the protected susceptibles were exposed for ten weeks to fresh cases An average dose of only 6 c cm was given on the sixth day after exposure (Hobson, 1934)

TABLE V—*School A (1938) Fifty six Susceptibles*

	No	Measles	Escaped
Unprotected	34	34	0
Protected	22	22 (attenuated)	0
Total	56	56	0

100 per cent infected, none escaped, 6 complications (otitis protected cases all had attenuated attacks

Discussion

The preparatory school of about 100 inmates is an almost ideal unit for purposes of epidemiological study, and the experience gained in handling such units may reasonably be expected to provide the materials for the formulation of principles in the conduct of epidemic disease in larger communities The size, character (day or boarding), composition (age and sex), and location of a given school may introduce a number of variable factors into the problem of the conduct of an epidemic, nevertheless the principles in conducting such an epidemic must hold if such be correctly conceived Measles is a disease which is peculiarly suitable for such a study

* One boy stated to have had measles and therefore not protected by serum developed measles, possibly a second attack

I have endeavoured in this article to formulate those principles which seem to me fundamental and to demonstrate that in practice they can be effective

Conclusions

The principles for the conduct of an epidemic of measles in a self contained school community are discussed and their application in practice is illustrated in four epidemics These principles are

1 That healthy susceptible individuals should be permitted to experience a normal attack of measles after exposure to infection

2 That delicate susceptibles should be protected " Delicate susceptibles fall into two categories (*a*) those for whom complete protection should be secured (*b*) those for whom attenuation should be a sufficient safeguard from undue risks

3 That environmental hygiene must be strictly practised in sick rooms for all cases

Experiences in the use of protective serum are described and emphasis is laid upon the inherent difficulties of posology In practice the date of administration should be calculated from the rash of the infecting case For *protection* a maximum dose should be given at the earliest opportunity after exposure and never later than the third day For *attenuation* a maximum dose should be given on the sixth day

SUBVESICAL DIATHERMY PROSTATECTOMY

BY

R OGIER WARD, M Ch, F R C S

Consulting Genito urinary Surgeon Miller General Hospital Assistant Surgeon St Peter's Hospital Genito urinary Surgeon Royal Masonic Hospital

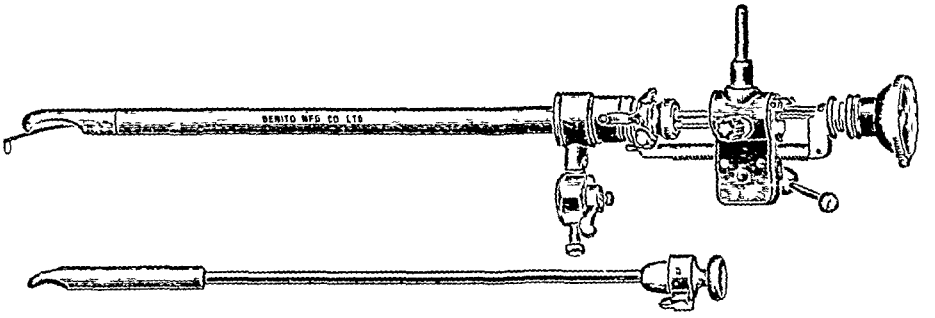
Perurethral resection of an obstructing prostate seems by now to have won an established place in genito urinary surgery Opinions vary as to the type of case in which it is best employed though most surgeons are agreed in preferring prostatectomy when dealing with a prostate which is much enlarged It should be remembered that when the enlargement is of a benign type the chief indication for advising such treatment is precisely the same as when prostatectomy by any other method is chosen—that is to say the presence of residual urine If this amounts only to an ounce or two it is unnecessary to employ either perurethral resection of the prostate or any other surgical treatment But although the measure of the residual urine is by far the most important guide to treatment obstruction may sometimes call for operation when the volume of it is not large for if the act of micturition is unduly difficult and prolonged the patient may experience much inconvenience particularly when nocturnal frequency is present Attention should also be given to the cystoscopic appearances of the bladder wall and marked signs of stress as evidenced by the presence of excessive trabeculation or more important still sacculation are an indication for the relief of the obstruction

The Usual Method of Resection

When early cases are treated very few cuts with the diathermy loop in the middle line and to right and left of it are all that is necessary and the same applies when the prostate is of the small but highly obstructive type It is when the prostate is moderately or much enlarged that the operation becomes more difficult and more formidable The dangers which attend it are *haemorrhage* and *sepsis* *Haemorrhage* is inevitable It is slight when fibrous prostates are treated and not usually abundant in cases of carcinoma though in some of these it is severe It is more profuse when cases of benign enlargement are operated upon Much of the bleeding comes from the region of the internal meatus where the diathermy loop cuts through the highly vascular trigonal mucosa beneath which lie also some of the most important arteries supplying the prostate itself It is from this same region that a very large amount of bleeding occurs in prostatectomy by enucleation *Sepsis* is common and often serious It occurs because necrosis is produced by cutting with the diathermy loop In the ordinary method of resection not only is the surface of the residuum of the gland which surrounds the prostatic urethra thus necessarily affected but a large portion of the trigone is also removed sometimes almost up to the ureters for it is only by sacrificing this that the diathermy loop can be engaged in the lateral lobes after the intravesical projection has been dealt with This is because the loop only moves and cuts along the axis of the resecto cope sheath If at the end of such a resection the bladder is opened it will be found that a cone of tissue has been resected from the prostate The apex of this is in the region of the verumontanum and its base corresponds to the trigone and the area immediately around the internal urinary meatus An exploratory finger now passes along the posterior bladder wall over the intereureteric bar and down into the prostatic region which is found to be laid wide open because a large part of the bladder base has inevitably been cut away This is of course quite different from the condition which exists when the operation of prostatectomy by enucleation is employed whether by the suprapubic or the perineal route In such cases the internal meatus though expanded is still comparatively small beneath the neck of the bladder there is a recess the prostatic fossa between it and the triangular ligament from which the prostate has been removed It is easy to feel and to see that the trigone itself has been left almost intact

The Modified Technique

It has seemed to me that such methods of perurethral prostatectomy should be avoided and that an endeavour should be made to make the anatomical result resemble as closely as possible that of prostatectomy by enucleation To achieve this it must be practicable to resect the gland from around the prostatic urethra and from beneath the trigone without cutting or in any way damaging this structure except to a very limited extent in the neighbourhood of the posterior mid line where this occurs in the process of removing the intravesical projection itself With this in view I suggested to Mr Schranz of the Genito Urinary Company that an inclined plane should be built into the end of the beak of the McCarthy resectoscope which would push forward the supports of the loop as this



is wound out of the sheath into the cutting position (See Fig) This has been successfully achieved in the model which he has produced for me, and as a result the whole extent of the loop projects in front of the sheath when it is in the extreme forward position For this reason, and because it is firmly supported the loop when activated by the diathermy current can be buried into the prostate much more deeply than is possible in the older type of instrument At the conclusion of the cut it is automatically withdrawn into the confines of the sheath The resection is begun in the middle line posteriorly first the loop may be placed over the intravesical projection in the usual manner until it is hidden from view, one such cut being usually sufficient After this the loop is not again allowed to enter the bladder cavity but from now on is placed always under vision in position against the prostate within the urethra at a level immediately below the internal meatus At the moment when the current is turned on the loop is first embedded in the tissues at this level by pressing the beak of the sheath firmly in the required direction, and then the cut is made from there downwards In other respects the procedure is that usually practised—namely, as much resection as is desired is carried out on one lateral lobe before treatment of the other side is begun These cuts, beginning always within the prostatic urethra resect chiefly the lateral lobes but must be continued well round to include the front of the gland on both sides Even with the aid of these new loops and the advantage which they give, it will be found that sooner or later a stage is reached when further cutting into the lateral lobes is mechanically impossible

At the end of a perurethral resection conducted in this manner if the instrument is withdrawn so that the objective of the telescope lies at the level of the verumontanum one finds oneself looking into a recess which has been excavated beneath the bladder and at the top of this is a small opening into the bladder, in other words the result is very similar to that which is produced after a prostate has been enucleated The opening into the bladder can easily be enlarged if it is desired, but I feel sure that the less of the trigone that is resected the better from the point of view of immediate haemorrhage and subsequent sepsis Because the aperture which leads from the prostatic fossa into the bladder is small some care is necessary in passing the catheter, which is to be left in position, as the point of it tends to be held up in the prostatic bed

If this technique, which may be called *subvesical* diathermy prostatectomy or prostatic resection, is employed it will be found that haemorrhage is less than with the older method and that it is more easily controlled Sepsis is also much diminished owing I believe to the fact that the trigone is left almost entirely intact instead of being mutilated One complication which is unavoidable when this new type of diathermy loop is employed is that the pieces resected are often too large to wash out through the resectoscope, and it becomes necessary to recover them at the conclusion of the operation by aspiration, using the bulb of a Bigelow's evacuator attached to the sheath of the resectoscope by a short metal adaptor or by grab forceps Since larger pieces are cut away by these loops than by those of the original type it is possible to work through a smaller sheath, and one of 26 Charriere scale will be found very efficient The risk of damage to the urethra is thereby lessened

The New Model Resectoscope

The new model of McCarthy resectoscope made by the Genito-Urinary Company is in several other respects a great improvement upon the previous models, from which it has been evolved The sheath, like the recent American pattern, is metal outside with the exception of the

bakelite beak, and this part of the instrument is now made shorter than in the original models—a modification which is essential if resection is to be carried out beneath the trigone, for which same purpose, as has been explained, the projecting loops have been specially designed The projecting loop has the further advantage that it is more easily seen than are those of the older patterns, being nearer to the centre of the telescopic field when in the extreme forward position from which the cut is begun These loops, the manner in which they are supported, and the new system of flushing are the only components for which I can claim originality The tap will be found satisfactory, as it gives simplified control and allows of a larger current of water Particular care should be taken not to over-distend the bladder, and therefore the top water-level in the irrigator should not be more than eighteen inches above the patient's abdomen

---

A course of lectures and clinical instruction for medical practitioners on problems connected with retarded and difficult children has been arranged by the University Extension and Tutorial Classes Council, in co operation with the Central Association for Mental Welfare, and will be held from Monday, November 7, to Saturday, November 12 It is open to those practitioners who have already attended the course on mental deficiency and allied conditions, or who have specialized experience approved for the purpose of the course The lectures will be delivered at the University of London, Senate House, Bloomsbury (entrance from Russell Square), unless otherwise stated on the students' time tables, and will be given from 10 a m to 12 30 p m each day Detailed time tables will be sent by October 31 to each person proposing to attend the course, and forms of application should be filled in and returned not later than October 7 The University will grant certificates of attendance to those who attend regularly, taking both theoretical and practical work Registration fee, 10s 6d, fee for the course £3 3s All communications should be addressed to Miss Evelyn Fox, c/o University Extension Department, University of London, W C 1

RUPTURE OF THE UTERUS DURING PREGNANCY

BY

JAMES RIDDELL M.D., F.R.C.S.Ed., M.C.O.G.

Honorary Gynaecological Surgeon Prince of Wales's Hospital Plymouth

AND

JOHN SCHOLEFIELD M.B., Ch.B. F.R.C.S.

Resident Surgical Officer Prince of Wales's Hospital Plymouth

The case of rupture of the uterus during pregnancy which is described in detail and discussed in this paper was that of a primigravida aged 20 admitted to the Prince of Wales's Hospital Plymouth

Clinical History

The patient was thirty-two weeks pregnant and had been attending an ante-natal clinic and had enjoyed health during the whole of her pregnancy. There was no history of any pelvic pain even during the early weeks of pregnancy. On the morning of admission to hospital she sat up in bed and was seized with severe abdominal pain. During the course of the morning she sent for a midwife who found her walking about her room complaining of a pain in the lower part of the abdomen on the right side. The midwife put the patient to bed and sent for the family doctor. He sent the patient to hospital having diagnosed acute appendicitis. She was admitted to hospital shortly after midday and was observed by one of us (J. S.).

On admission the patient looked pale and toxic. There was not any restlessness but her respirations were rather rapid and there was some dyspnoea. The pain was referred to the right hypochondrium and was of a colicky nature. There was some tenderness in the right hypochondrium but not any rigidity and pressure here resulted in a series of short rapid respirations. The uterus appeared normal for a thirty-two week pregnancy and a living child in the left occipito-anterior position was diagnosed.

The urine was carefully examined to exclude a pyelitis and a physician's opinion obtained to exclude an acute diaphragmatic pleurisy. The tenderness appeared to be too high for appendicitis and the history did not support such a diagnosis. A provisional diagnosis of an acute cholecystitis complicating pregnancy was made and the patient was placed in the Fowler position and put on fluids for observation. During the next few hours the pain did not show any signs of abating and the tenderness had increased. A further opinion was sought.

Further Examination of the Case

The patient was referred to me (J. R.) at 10 p.m. on the evening of her admission to hospital. She was complaining of severe pain under the costal margins and under the shoulder blades and was in great distress particularly with dyspnoea. There was not any pain referred to the shoulders.

The outline of the uterus was regular and was clearly defined. The uterus was enlarged to the size of a thirty-two week pregnancy. The foetal heart sounds were heard. Above the level of the uterus the abdominal wall was flaccid but there was pronounced tenderness under the costal margins. There was slight bleeding from the vagina. The external os was closed. The patient was not in labour. Examination of the chest did not disclose anything abnormal. The urine was free from pus cells and *B. coli*. The temperature was 98.8°, pulse 120, respirations 28.

I was not able to make a diagnosis though I considered that an acute abdominal emergency might be in progress, possibly an internal haemorrhage. I was not able to satisfy myself that there was sufficient evidence to warrant opening the abdomen that night. I desired to wait and to make further observation. An hourly pulse chart was arranged for and a request was made that I should be called if the pulse rate increased appreciably. A third of a grain of omnopon was administered hypodermically. The patient slept and the pulse rate fell to 90 by 6 a.m.

I saw the patient next day shortly before 1 p.m. when I found that the clinical picture had changed. The patient was sleeping but her face had a more distressed expression, she looked pale with shallower rather quicker and slightly more embarrassed respiration.

The abdominal wall was rigid and tense, the uterine outline was not manifest any longer, there was a more diffuse swelling of the abdomen due to some distension. Liver dullness was absent. I made a diagnosis of internal haemorrhage. Rupture of the uterus was discussed but there was not sufficient evidence to support that diagnosis with confidence. There was only sufficient evidence to warrant a diagnosis of internal haemorrhage.

Operation

The patient was removed to the operating theatre. I opened the peritoneal cavity through a left paramedian incision partly above the umbilicus and partly below, in order that I might have liberty to enlarge it upwards or downwards depending upon what was discovered to be the source of the bleeding.

On opening the peritoneal cavity a bag of membranes was seen. Rupture of the uterus was not obvious. The incision was extended downwards. The uterus was felt contracted in the bottom of the pelvis. The foetus (dead), membranes and placenta were removed. The uterus was lifted up. At the right cornu a four-inch rent extended down the right side of the uterus. The uterus was elongated and marrow-shaped.

At the site of the rent the wall of the uterus was thin. Bleeding was not in progress though there was a considerable quantity of blood in the peritoneal cavity. I did not waste time exploring the inside of the uterus. The right tube was not continuous with the uterine wall. It looked natural and healthy except that it ended proximally in a healed stump as though it had been amputated. The centre of the rent in the uterus corresponded with the point at which the tube would normally have become continuous with the uterus. The right ovary was calcified. The left tube and ovary were natural.

The rent in the uterus was sutured, most of the blood was removed from the peritoneal cavity, drainage was provided and the patient was returned to bed as quickly as possible. She recovered quickly and went home on the fifteenth day after operation.

Remarks by Mr. James Riddell

In the case of rupture of the uterus during pregnancy which I described in 1926 there had been previous damage to the uterus following miscarriages. Hysterectomy was employed and the patient recovered. In the case now under review there had not been any operation upon the uterus. There was not any history of injury or violence of any kind.

Munro Kerr has described angular pregnancy and he states that atypical examples may be encountered partly interstitial, partly angular. It is suggested that this case is an example of a pregnancy partly interstitial partly angular. Munro Kerr quotes Kupferberg who described a case in which the body of the child was in the tube and the head in the uterus. The interstitial element would account for the erosion of the tube by the

trophoblast and its gradual amputation from the body of the uterus It is not possible for a developmental defect to account for the want of continuity between the tube and the uterus The tube was properly developed, and was not in any way under-developed The uterus was properly and naturally developed It is possible that after the erosion of the tube the ovum may have moved a little more downwards and embedded itself more comfortably in the uterus

The ovum developed not *in substantia uteri* but towards the uterine cavity though almost wholly in it, and that constitutes the "angular" element which led to thinning out of the wall of the uterus at the right cornu Eventually the wall of the uterus became so thin that the exertion of sitting up in bed was enough to rupture it There was not any recognizable lateral distension of the uterus in the region of the uterine cornu Obliquity of the uterus was not observed before the operation and there was not any evidence of it at the operation There was only thinning of the wall at the right cornu

Lateral distension of the uterine cornu is one of the main features described by Munro Kerr Therefore there must be grades of cases—if my explanation is correct—some without much lateral distension of the uterus Most "angular" pregnancies produce great pain and lead to abortion If there were not much sacculation at the cornu but only thinning of the uterine wall and if the ovum found a more secure resting place, then abortion would not be likely to occur This would explain why the patient did not abort

If my explanation is not correct then one must suppose that the ovum was properly embedded in the uterus from the start and that the amputated tube and the thinned-out cornu did not have any relation to it, but were entirely unconnected with it, being due to some pre existing unexplained disease or injury

The patient has promised to report if she becomes pregnant again in order that her progress may be watched

Summary

1 The clinical history of a case of rupture of the uterus during pregnancy is reported The patient recovered after suture of the rent

2 It is suggested that the cause of the rupture was a pregnancy partly "interstitial," partly "angular"

The two Chambers of the Swedish Riksdag have passed a Bill for public dental care The new Act provides for dental treatment for all infants and school children, as well as for adults at a nominal charge, or free of charge in the case of families of small means As regards children public dental treatment will be available to all between the ages of 3 and 15 years The annual fee is 5 kr for the first child, and 3 kr and 2 kr for the next two children, of a family registered at one and the same time for receiving State dental care If there are more than three children in a family the rest will be treated free As regards adults treatment is to be given at cost price or at a reduced fee or gratis when warranted The Act provides for a division of Sweden into dental districts, with whole time dentists and attendants for each The cost of organizing and maintaining the service will be divided between the State and the county councils or municipalities

Clinical Memoranda

Concurrent Puerperal Anaerobic Streptococcal and Staphylococcal Septicaemia with Recovery

We feel that points worthy of notice in this case are, first, the unusual combination of organisms in the blood stream, secondly, the response to staphylococcal antitoxin in a patient who was gravely ill, and, thirdly, the presence of septicaemia after a considerable amount (66 grammes) of sulphanilamide had been given The response to the staphylococcal antitoxin suggests that the presence of the anaerobic streptococci in this case was of minor importance

Mrs M, aged 32 years was delivered of her second child on February 15 1938 The first and second stages of labour were normal, but there was delay in the delivery of the placenta, which was removed manually under general anaesthesia On the following day the patient complained of intense headache, shivering, and insomnia She vomited several times In the evening her temperature rose to 101° F

She was admitted to hospital on February 17 Her temperature was 98° F, pulse 108, and respirations 24 She was pale and appeared ill The fundus of the uterus was palpable two inches below the umbilicus and was not tender Vaginal discharge was scanty and haemorrhagic Examination of other organs showed no abnormality Sulphanilamide 4 5 grammes was given daily by mouth, and 1 c cm pituitrin hypodermically twice a day

The day after admission she passed a piece of membrane per vaginam Next morning her temperature rose to 101 2° F and her pulse rate to 120 per minute Her condition became steadily worse, and on February 24 the temperature was 103 2° F and she had a slight rigor On the following day 20 c cm scarlatinal antitoxin were given intramuscularly and 60 c cm intravenously on the 26th, after this her temperature fell to normal for the first time for seven days but rose again next day and continued to swing between a maximum of 104 2° F and a minimum of 99° F for the next three weeks

On March 3 a blood count showed Red cells 2,164 000 per c mm White cells 3,600 per c mm (polymorphs 64 per cent, lymphocytes 32 per cent, monocytes 3 per cent, eosinophils 1 per cent) Haemoglobin 30 per cent Colour index 0 7 Reticulocytes 4 5 per cent There was marked anisocytosis and some poikilocytosis of erythrocytes

Blood culture on March 4 gave a growth of non pigmented staphylococci which were thought to be due to contamination of the culture Her clinical appearance now became typically that of septicaemia, and on March 6 she was given a transfusion of 15 oz of her husband's blood, this was followed by some temporary improvement On the 9th the blood culture was repeated and gave a similar growth of staphylococci which were haemolytic and showed slight pigmentation of the *aureus* type at the end of forty eight hours' incubation An anaerobic culture was made simultaneously, and this showed the presence of anaerobic streptococci as well

It was now decided to give staphylococcus antitoxin As she had had serum a fortnight previously she was given two small desensitizing doses of the antitoxin subcutaneously at an interval of three hours, and later the same day (March 12) 10 000 units intramuscularly This latter dose was repeated on the following day By this time her condition was very poor temperature 104° F, pulse rapid, skin yellow, and mucous membranes pale, there was a systolic bruit at the apex and she was incontinent of urine and faeces She had also developed a massive generalized oedema involving all limbs, face, and back, which may have been due to the serum

On March 14 another 10 000 units of staphylococcal antitoxin were given intramuscularly followed by 10 000 units intravenously Just after this the patient collapsed but rallied a little on the injection of adrenaline ieoral and continuous rectal saline and glucose During the next three days she seemed to be *in extremis* but on March 17 the temperature and pulse rate began to fall and by the 22nd were normal Her general condition improved she became rational the oedema disappeared and she regained complete sphincteric control From this time steady progress was made without complications or rise of temperature

On April 22 a blood count showed Red cells 3 046 000 per c mm White cells 8 600 per c mm (polymorphs 55 per cent lymphocytes 36 per cent large mononuclears 7 per cent eosinophils 1 per cent basophils 1 per cent) Haemoglobin 65 per cent Colour index 0 9 Reticulocytes 1 6 per cent A blood film showed hypochromia of red cells otherwise nothing of note

The patient was discharged well on April 30 Other medicaments used in the treatment of the case were vaginal douches potassium citrate Blaud's pill and various sedatives Total dosage of sulphanilamide was 66 grammes Administration of this latter drug was stopped on March 3

We wish to thank Dr W Edge medical superintendent Ladywell Isolation Hospital for permission to publish this case

Simultaneous Fracture of Both Wrists

The following case of simultaneous fracture of both wrists may be of interest as demonstrating the rapid restoration of function and the minimal period of disability under treatment by Bohler's technique

CASE REPORT

On November 7 1937 a Cambridge undergraduate a member of the Climbing Club fell 20 feet from a tree landing on both hands with the wrists in flexion He could use neither hand owing to pain and swelling and was brought to see me by a friend The right wrist was swollen and very painful and there were fusiform swellings on the dorsum of the wrist more marked on the radial side corresponding to the extensor sheaths There was no bony displacement palpable and no history of cracking at the time or of crepitus since he sustained the injury The left wrist joint was also generally swollen and there was tenderness and more marked swelling over the styloid process of the ulna with no obvious sign of fracture The patient was unable to use either hand in any way He could not lift a cup of tea fasten a button open a door or do anything at all for himself For this reason he was admitted to a nursing home and the wrists were at once supported by elastoplast reinforced with interlocking split tailed strips of plaster the right wrist being put up temporarily on a Carr's splint A ray examination showed a fracture of the lower end of the right radius just above the wrist joint with no displacement and a fracture through the base of the styloid process of the left ulna with minimal displacement In addition there was obviously acute traumatic synovitis of both wrist joints and acute traumatic tenosynovitis of most of the extensor tendon sheaths on both sides

On November 8 after the results of the x ray examination were known a 6 inch dorsal cellona slab was applied to the right forearm from just below the elbow to the level of the heads of the metacarpals The cast was completed according to Bohler's method of treating a Colles's fracture with the palm left free save for a copper wire across the distal crease a modification suggested by K Pridie The left forearm and wrist were treated in the same way The patient was instructed to use both hands freely On the following day at 9 30 a m the patient was able to write his name legibly but poorly he gripped and used a tumbler with either hand picked up small objects and was able to help in dressing himself By 5 o'clock that day his signature had improved he was able to lift both arms above his head and he could carry a bag of instruments without pain His grip was already much stronger Later he was able to use a knife and fork and take his own dinner After three days he returned to his college attended all his lectures and dined nightly in Hall In fact he lived a normal life except that he did not play games Three and a half weeks later the plaster casts were removed and the movements of the wrist-joints were found to be practically normal as regards flexion and extension Pronation and supination became full in a few days time

A Case of Locked Twins

Owing to the rarity of locking complicating labour in twin pregnancies the following notes on a case recently met with may be of interest

HISTORY OF CASE

A woman aged 24 was pregnant for the second time the first pregnancy having ended in abortion at 12 weeks During the present pregnancy she had a threatened abortion at twelve weeks and later developed mild albuminuria which settled with rest in bed

Labour started in the morning of February 2 a fortnight before term Uterine contractions were weak and infrequent but by 5 p m on February 3 the second stage of labour appeared to have begun At 5 p m a vaginal examination was made and a vertex (right occipito anterior) felt low down in the pelvis the cervix was fully dilated and the membranes ruptured By 6 30 p m no progress had been made and meconium began to pass per vaginam At this time the patient's general condition was very fair Pains were regular the uterus was rather tender and irritable making abdominal examination difficult but a head could be made out entering the pelvis

Vaginal examination under anaesthesia revealed a small head low down in the pelvis presenting as a right occipito-anterior with a loop of cord prolapsed alongside it this was pulsating regularly On further investigation a second head was found in the pelvis presenting as a left occipito posterior somewhat to the left of and posterior to the first It was at a higher level in contact with the anterior shoulder of the first foetus which it was preventing from descending further The membranes of the second sac were intact

The second foetus was pushed up out of the pelvis and the first delivered with the forceps It was rather shocked but soon recovered After fifteen minutes the second head was found to have descended on to the pelvic floor and the membranes were ruptured and five units of pituitrin given as uterine contractions were very weak There was little response to the pituitrin so this foetus still occipito posterior was also delivered with the forceps It was in good condition and cried at once The third stage lasted about fifteen minutes when both placentae were expelled together There was very little haemorrhage

The children were female binovular twins weighing 4 lb and 3 lb 12 oz respectively The placentae were entirely separate Subsequent progress of all three patients was uneventful

Locking of twins is generally attributed to deficiency of liquor amnii in cases where there is a relatively large pelvis In the case reported the pelvis was of average size (external measurements 10½ 11½ and 8 inches) but the foetuses were small At the time of delivery the first amniotic sac was dry and the second contained only an ounce or two of liquor

AN ANTHROPOLOGIST SPEAKS OUT

Apes Men and Morons By Earnest Albert Hooton (Pp 307 10s 6d net) London George Allen and Unwin 1938

Dr Earnest Hooton, the distinguished professor of anthropology in Harvard University, has come to occupy a favoured place in the minds and hearts of his fellow-countrymen This is because he has added to the erudition of his special subject a power to see things with the humorous eye of Mark Twain and the courage to force unpleasant truths upon the consideration of his readers The burden of his book is this Unless civilized humanity pays some attention to the kind of progeny it begets, then its doom is sealed "Man has tried to improve everything except himself," he exclaims And again "Man is a tottering biped and we must look to his organic underpinning'—the underpinning being man's "animal self In brief, what is needed first and most is that the great public should become familiar with the elements of their own physiology But alas! it must also be added that Professor Hooton has no confidence in the wisdom or judgment of the man in the street

It must not be inferred that *Apes, Men and Morons* is a sermon preached on a single text Taking it all and all it is the best popular summary available of the hundred and one problems that are now occupying the attention of anthropologists and eugenists in all countries of the world Although the contents of this book represent a series of addresses given at sundry times to diverse audiences, yet the subjects were so chosen that the whole field of anthropology is covered in a systematic manner The history of man, as revealed by fossil bones, is well told then follows an exposition of our present knowledge—and lack of knowledge—of the evolution of man Then living races and types of mankind are passed in review then follows a special section—Professor Hooton's own section—that of social anthropology Lastly, a eugenist chapter—"What must we do to be saved?"

There may be exaggerations and excesses here and there, but there is also much real wisdom as well as learning, there is certainly not a dull page in the book

CONTROL OF DISEASE

General Hygiene and Preventive Medicine A Textbook for College Students Medical Students Nurses Public Health Workers and Social Workers By John Weinzirl M S, Ph D Edited by Adolph Weinzirl B S, M D (Pp 424, 18s net) London Henry Kimpton 1937

In presenting a medical subject to the generality it is sometimes difficult to fix upon a grouping or arrangement of the material which will appear sensible to the non-medical reader without doing violence to the facts of medicine The purely aetiological approach is usually barred since it presumes previous knowledge, and other ways, less good in themselves, may have to be sought out In their recent work on hygiene, addressed in part to lay persons, including teachers, philanthropists, publicists, and others, Professors J and A Weinzirl have grouped the disease conditions which they describe in the light of the means adopted for their control 'An attempt has been made they say to subordinate facts to methods So spake, or might have spoken Procrustes as he lopped or stretched his guests to fit the notorious bed Here and there in the book as is almost inevitable in the circumstances, we encounter the Procrustean touch, as where it is said that the "incubationary stage" of acute alcoholism is a matter of hours Nevertheless, for a work written with a view to the enlightenment of laymen, the criterion "what is being done' is, we think, happily chosen It is calculated to appeal to the practically minded average man, who, after all, will not go far wrong if he thinks of small-pox as a disease to be controlled by vaccination, scurvy by correct feeding, malaria by dealing with the mosquito, and moronism, *Anglice* feeble-mindedness by the application of eugenic measures

The book by the two professors is sound in the essentials It is wide in range, adequate in detail, and informative without over-elaboration It will interest those for whom it is principally intended and will be found of service also by medical officers

A STUDY OF CEREBRAL FUNCTION

The Brain and its Environment By Joseph Barcroft (Pp 117, 30 figures 9s net 2 dollars) London Humphrey Milford Oxford University Press, New Haven Yale University Press 1938

This book is founded on the Terry Lectures delivered by Sir Joseph Barcroft at Yale University in 1937 and is a study of the relation between the functional activity of the mammalian brain and the internal environment during the changes from intra-uterine to adult life

The investigation has been carried out in both sheep and goats It is shown that the oxygen supply does not increase during the last third of pregnancy, although the weight of the foetus increases tenfold The result of this is a marked fall in the oxygen pressure in the blood supplying the brain over this period A study of the reactions of the developing nervous system reveals that at the end of the first third of pregnancy movements can be elicited in response to tactile stimulation which correspond to the locomotor and respiratory functions which will come into play after birth Such movements are either abolished by asphyxia or are replaced by a more primitive and generalized response During the remainder of pregnancy these reflex activities are inhibited by the development of higher centres in the nervous system which are themselves put out of action and he early reflexes re-established by asphyxia

At birth both the external and internal environment of the brain undergo abrupt change The oxygen saturation of the carotid blood was directly measured electrically, and in this way a comparable photographic record was obtained of the activity of the respiratory centre and the oxygen supply to the brain From this the author comes to the conclusion that the respiratory centre is stimulated at birth primarily by cutaneous sensations (cold, manipulation, etc), and secondarily by the effect of asphyxia in releasing the primitive respiratory movements from the inhibitory control of the higher centres It is also shown that the cardio-inhibitory, the cardio-accelerator centres, and those responsible for the maintenance of muscular tone are brought into play by the advent of sustained respiration at birth

With regard to the factors controlling the oxygen supply of the brain at birth, it is shown that the nature of the haemoglobin is changed before birth, so that the foetal type of oxygen dissociation curve is replaced by the adult type, which is more suitable for the higher oxygen pressures encountered in post-natal life Furthermore, evidence is brought forward to show that the ductus arteriosus is closed abruptly at birth by a neuromuscular mechanism developed during foetal life Finally, the

author discusses the effect of changes in the internal environment in the brain of adult human beings and shows that excess or deficiency of oxygen carbon dioxide glucose water and salts and variations in temperature produce effects which can be classified as either excitatory or depressive He concludes with a reaffirmation of Claude Bernard's words that the fixity of the internal environment is the condition of the free life —that is to say the development of the intellectual powers of man

Clearly this is a valuable contribution to the study of cerebral function which is one of the most important fields of research at the present time

A MANUAL OF OTOLOGY

Kurzes Handbuch der Ohrenheilkunde By Dr Hermann Marx (Pp 846 465 figures many in colour RM 46 bound RM 48 50) Jena Gustav Fischer 1938

Professor Marx's recently published *Short Manual of Otology* runs to over 800 pages and covers the whole ground in an extremely able manner The matter is arranged on the recognized lines a general section dealing with a description of the anatomy and physiology of the ear and the functional tests (142 pages) a special section (600 pages) dealing with the diseases of the ear—inflammatory new growths traumatic lesions and congenital deformities in that order The author's views and theories are mostly the orthodox ones but in many sections the more individual teaching of the Wurzburg school is obvious In the physiology chapter the tympanic muscles are described as a protective mechanism and it is stated that there is not sufficient evidence to support an accommodation theory The two tympanic muscles are not antagonistic and their contraction serves only one purpose which is to protect the cochlea against too intensive sound impressions especially of the high pitched variety

The semicircular canal function and tests are dealt with exhaustively On the other hand the reflexes of the otolith end organs in spite of the enormous literature which already exists on the subject are dismissed in a one page paragraph because it has now been shown that tonic labyrinth reflexes function even after destruction of the macula in the saccule and therefore the question of the reaction of position is still unsolved A most useful distinction is made between the pathology of acute and that of chronic middle ear suppuration The usual end result of acute middle-ear suppuration is *restitutio ad integrum* (p 197) Chronic suppuration does not result from neglected acute suppuration but has an insidious origin and the seeds of chronicity are there from the beginning Here the author on the whole accepts Wittmaack's theory of the infantile hyperplastic changes in the tympanic mucous membrane Much futile discussion would be saved if this aspect of the pathology of middle-ear suppuration were always borne in mind

In the after treatment of mastoid abscess Professor Marx advises against packing because this carries a risk of fistula The wound is closed straight away except for a strip of gauze in the lower angle The so called recurring mastoiditis is not an osteitis but simply a formation of pus in the old scar tissue a stab incision to let out the pus is sufficient in such cases An interesting end result of sinus thrombosis not usually described in textbooks is the organization and calcification of the clot A complete bony occlusion of one transverse sinus may result and one such specimen is illustrated In the chapter on syphilis of the inner ear it is clearly stated that salvarsan is not the cause of the damage to the eighth nerve When deafness tinnitus and vertigo arise in the course of treatment the salvarsan injections must be persevered with until the inner ear symptoms disappear Acusticus tumours although arising in the cerebello pontine angle are dealt with because they must be considered as tumours of the ear origin

The illustrations throughout the book are well chosen and well printed As a model of clearness one may specially commend Fig 33 which illustrates the complicated anatomical relation of the levator palati and tensor palati muscles to the Eustachian tube The series of actual photographs of benign and malignant tumours of the pinna and meatus and those illustrating congenital deformities of the outer ear are particularly successful We note as a useful feature the full references to current literature which are given at the end of each chapter In Professor Marx's own words this manual is intended for the young otologist starting in practice (angehender Ohrenarzt) and it may be confidently recommended as a reliable textbook The German style is easy to read

INTRACRANIAL TUMOURS

Tumeurs Intracraniennes Etude Analytique de 2000 Tumeurs Verifiées et de leur Mortalité Operatoire By Harvey Cushing (Pp 194 111 figures table 20 frs) Paris Masson et Cie 1937

The French translation of Dr Harvey Cushing's book on *Intracranial Tumours* which appeared in 1932 has been enlarged by two studies on the late results of operation for cerebral tumours one by Dr van Wagenen and the other by Professor Hugh Cairns These statistical studies show a surprisingly long period not only of survival but also of useful life in many forms of intracranial tumour Van Wagenen gives an average period of working life of a year or more in all forms of intracranial tumour except medulloblastomas glioblastomas and metastatic cancers In Cairns's statistics it is surprising to note that individual cases of cerebral glioma pituitary adenoma and tumour of the acoustic nerve have survived for twenty five years after operation While the average survival period is much less for cases in which the tumour cannot be completely removed the results obtained justify the unique position which Dr Harvey Cushing's clinic holds in neurosurgery and the faith in the future of his specialty which has sustained him throughout his career

The French edition also contains a short chapter on basophil adenomas of the hypophysis a form of tumour which was scarcely recognized at the date of the American edition and on which the author has since contributed valuable knowledge Owing no doubt to difference in the paper used the illustrations appear to be clearer and more brilliant than in the original edition

HAEMATOLOGY

A Textbook of Haematology By William Wagner M D D P H (Pp 395 23 figures 3 coloured plate 3 charts 18) London J and A Churchill 1937

It seems that every professor of pathology is expected to publish his own book of haematology for the special use of his large class of students the result is a superfluity of haematological textbooks overlapping each other for of late the format of these books has become and stereotyped and choice is only narrowly is noticeable that with the increasing n the professors have become more ca opinions Professor Wagner introd versial questions such as the deve white cells the origin of platele

views of several authors for and against some particular theory but refrains from expressing his own personal views of these questions It would be useful to know which special form of haemoglobinometer he favours, also on which haemocytometer chamber and methods he relies for the enumeration of cells He makes no mention of "Price Jones" mean diameter distribution curves for determining the size of red cells and the degree of anisocytosis, which is so essential for the correct diagnosis of anaemias and is in common use in this country

Owing to the employment of surfaced paper the weight of the volume is unduly great but the reader is recompensed by the excellence of the coloured plates It is a pity the photomicrographs are not sharp and do not convey very much It may be a mistake to include in a book of this character the clinical and therapeutic aspects of the anaemias described, but this is a common habit, and Professor Magner is in good company

Notes on Books

The Psychology of Early Growth including Norms of Infant Behavior and a Method of Genetic Analysis, by ARNOLD GESELL M D, and HELEN THOMPSON, Ph D, is published by the Macmillan Company at 17s This important book of reference comprises a summary of the work of Professor Gesell and his colleagues at Yale University on the mental development and behaviour of infants Thanks to this work we are beginning to obtain a very fair idea of what the normal infant can do at various ages and how far deviations from the normal are to be regarded as non-pathological It is only by establishing this norm that we can study abnormalities with intelligence and discover what conditions in infancy may be recoverable and what must be regarded as inevitably permanent handicaps The medical man who is concerned with the diagnosis and prognosis of injuries and developmental defects in infancy will find a wealth of material in this volume which will serve him in very good stead in controlling his own observations

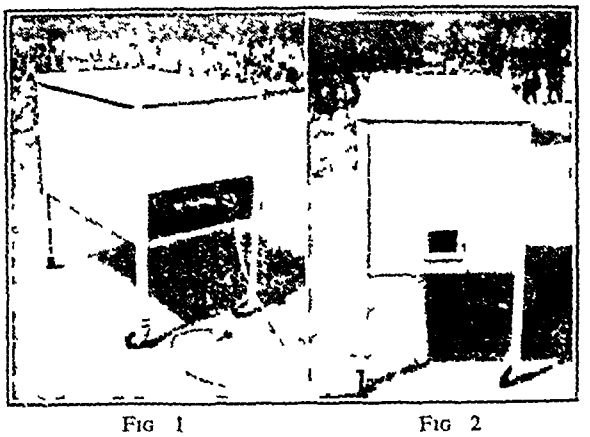
Der Schwachsinn by F DUBITSCHER (Leipzig, Georg Thieme) is the first of a series of volumes edited by Arthur Guett director of the Health Department in the Reich and Prussian Home Ministry, under the general heading *Handbook of Hereditary Diseases* The first part of the volume deals with mental defects (classification, aetiology normal personality, physical symptoms of feeble-mindedness, mental symptoms, general pathological-anatomical and pathological-histological findings, special kinds of feeble-mindedness, ethical deficiency, diagnosis, social importance of feeble-mindedness, measures against feeble-mindedness legal aspects) The second part is devoted to intelligence tests The main tasks of the health administration in the fight against feeble-mindedness appear to be to determine biological psychic unities and to study the heredity of these single characters, to identify diseases, related to feeble-mindedness belonging to the oligophrenia group in the sense of Weygandt, to study the connexion of social conditions and feeble-mindedness, to examine systematically all the children who leave special school classes for feeble-minded children or who leave school prematurely Will it be possible to eliminate feeble-mindedness by legal measures based on considerations of heredity? Certainly not But the problem is not "When will feeble-mindedness have ceased to exist?" but "How much would feeble-mindedness spread in a certain period without such legal measures?"

In the *Annales de Merck* for 1938 (first part) there is an article by Dr Albert von Szent-Gyorgyi on "New Perspectives in Vitamin Therapeutics

Preparations and Appliances

ELECTRICALLY HEATED COT

Dr WILLIAM MORE (Stockport) writes The problem of maintaining the body temperature is one of the chief difficulties in the management of premature infants Warmth is usually maintained by hot-water bottles wrapped in blankets, by electric blankets or by some form of incubator Enclosed incubators in which the air is stagnant are not advisable, an electrically heated cot in which there is a gentle current of warm air is preferable In the incubator described below there is no thermostat, but the temperature can be maintained



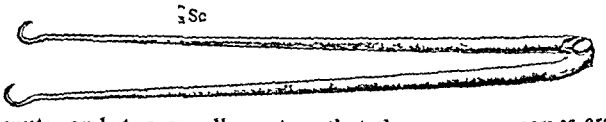


FIG 1 FIG 2

at a level between 70° and 80° F The details of its construction are as follows The cot is made of angle iron, electrically welded and covered with 17 s gauge gauze on the outside and 22 s gauge gauze on the inside A space is left between the inner and outer walls, the space being heated by six 16 c p carbon filament lamps, controlled by three switches, as seen in Fig 1 Each switch controls two lamps A glass pane is inserted in one end of the cot so that it can be ascertained which lamps are in use (Fig 2) All the wiring is asbestos-covered and an efficient earth is provided The number of lamps used to attain the required temperature will vary with the room temperature, but once the desired temperature has been reached this remains at a constant level However if the room temperature varies a great deal occasional adjustment of the switches on the cot will be necessary Three of these cots have been used with success in Stepping Hill Hospital during the past two years I am indebted to Mr Shawcross, the hospital engineer, for his skill in constructing them

A SKIN RETRACTOR FOR PLASTIC SURGERY

Mr GRAHAM HUMBY (London, W) writes

It is with deference that this retractor is offered because it is only of use to those who are interested in plastic surgery, and it is apparent that their numbers are limited The utility of fine hooks for skin retraction in this work is beyond

dispute and it is equally certain that the surgeon's nerves are often frayed when two such hooks are being used, because, unfortunately, telepathic control of an assistant's hands is an ideal rather than a reality It is for this reason that two hooks have been joined together at their proximal ends, thus eliminating a separate hook and a separate tremor The retractor can be used as a single hook when the two arms are approximated or as a double hook by inserting a finger in the acute angle formed by the arms the number of fingers inserted determining the distance and the tautness of the skin between the two hooks This instrument was made for me by Messrs Down Bros

BRITISH MEDICAL JOURNAL
LONDON
SATURDAY JULY 23 1938

THE PRESIDENTIAL ADDRESS

Successive Presidents of the British Medical Association have of recent years devoted a considerable portion of the presidential address to a consideration of the public relations of the profession and to a discussion of its future development and organization in view of the needs of the community. Dr. Colin Lindsay at Plymouth gave his address the simple title 'The Profession and the Public' indicating that the interrelations of these two bodies continue to be the appropriate subject of thought and pronouncement even at the inauguration of a meeting the intent and content of which are predominantly scientific. We print the address in this issue of the *Journal* at p. 163. The new President speaks from an experience of more than forty years as a general practitioner and consulting physician. He emphasizes in particular the pressing need for continued education both for the public and for the practitioner, and the value and wisdom of the policy of the Association in this regard and of its recently revised and re-issued Proposals for a General Medical Service for the Nation. This was both opportune and helpful at the end of a year during which the Council has devoted a great deal of time, care, and attention to the re-presentation of those proposals, to the formulation of its policy on some other very important medico-sociological questions, and to the development of methods by which the work and opinions of the Association can properly be made more widely and accurately known and its influence extended.

It was timely, too, that the President should remind the public of the unity and equality of the three main branches of the profession—the general practitioners, the consultants, and the members of the public health service. They have a common basic training and tradition; each branch provides a specialist service in its own sphere; and "there is no real reason why one branch should be from its nature more eminent that the other. They are essentially complementary and each requires for its proper performance attainments of the highest order." It is probably true at the present time that while it is to the family doctor that individual members of the public give their greatest confidence, general practitioners collectively have a less high place in the public regard than the other two branches. Perhaps Dr. Lindsay in his address overemphasizes this, as indeed have several recent pronouncements. He goes so far as to say that "there is a tendency for this branch of the profession to sink lower and lower in the estimation both of the public and of the student body from which the profession is recruited." He puts it in this way merely to heighten the contrast between this situation and what the general practitioner really is, and the fact that 'a reaction from this attitude is inevitable'. The more the public is educated, and the more the health services extend and intrude themselves into the lives of the people, the more will there be required an active and intelligent family doctor service." There are indications that this reaction has already begun. There appears in fact to be less and less dissent from the proposition that any reconstruction of medical organization for the public health must be based upon the work of the general practitioner. As to this future work the President declares that "all direct contact with the public as individuals should be in the first instance through the family doctor. There should be no short-circuiting or duplication of his services' and in a rather striking phrase he says that the family doctor service will be no corps of clerks but a highly trained and skilled body of persons who will ensure the early recognition of diseased states, the application in ordinary cases of those psycho-therapeutic methods which are becoming more and more a national need, the proper co-ordination of extending specialist services, and the more effective education of the public in medical and health matters.

In the President's reference, in the passage previously quoted, to the opinion of general practitioners held by the medical students from whom they are to be recruited, there is a shrewd touch. It is perhaps intended to convey to the teachers in medical schools a warning that it is both easy and very unwise to create in those schools an atmosphere which is unfavourable or detrimental to the status of the general practitioner. This is not a new thing. It was probably more prevalent thirty or forty years ago than it is to-day, though the effect produced was not and is not deliberate or intentional. Three-quarters of the students still pass into general practice, and no effort should be spared to present to them a high ideal of what such practice should be and usually is, and a sense of its paramount importance in the medical field.

The whole Association—and indeed, the whole profession as well as others—will wish to join in the welcome given to the President at Plymouth and in the hope that his year of office will be both pleasant and successful.

CANCER OF THE LUNG

"Any disease which throughout a quarter of a century develops from a position of obscurity to one of comparative prominence can scarcely avoid exciting the interest of the inquiring medical mind" This opening sentence forms the justification for Dr E J Simons's monograph[1] on carcinoma of the lung, and affords an opportunity of reviewing here some of the facts and fancies about this condition Is the increased incidence of bronchial carcinoma fact or fancy? Is it real or apparent only because of such factors as improved diagnosis? There can be no doubt that methods of diagnosis have improved and that therefore more cases have probably been diagnosed than would have been formerly but in addition to this Simons believes that the rate of increase in cancer of the lung has accelerated considerably since the early years of the present century He also finds that in some localities the greatest incidence seems to have been reached in 1924, and that in others it is still on the increase As with cancer in other parts of the body, the question of aetiology raises many baffling problems There is little evidence of any hereditary influence, and injury to the chest does not seem to be important, although cases have occasionally been found in which a single severe injury preceded the development of a growth in the lung In the cancer of the lung of the Schneeberg miners inhaled dust appears to be an undoubted aetiological factor the dust contains a variety of irritants, including bismuth, nickel, and cobalt, but the balance of evidence incriminates arsenical dust or radioactive substances Active tuberculosis is present in about 10 per cent of cases of bronchial carcinoma, this, however, cannot be held to have relevance to the question of causation Although it has been suggested that there is some connexion between chronic disease of the lung and cancer of the lung, so many different diseases have been suggested and so few cases have been put forward in support of each individual condition, that the causal relation is by no means clear-cut The inhalation of dust tar particles petrol fumes, and poisonous gases has been blamed but it is not easy to say where the blame lies if any In view of the extent of tobacco smoking it was to be expected that the possible part played by this in the development of cancer of the lung should be subjected to inquisition From what has already been published it is plain that the innocence of tobacco is by no means clearly established Further study of this question is needed

When we come to pathology we are on surer and more familiar ground The main group of tumours is composed of undifferentiated cells which take their origin in the deeper layers of the bronchial mucous membrane This membrane is composed of transitional epithelium, with a basal layer of rounded or oval cells and a superficial layer of columnar cells the whole membrane is derived originally from the primitive hypopharynx, which produces the squamous epithelium of the mouth and oesophagus From these cells the three common histological types of carcinoma are derived the "oat-celled" (which is the most primitive), the columnar-celled and the squamous carcinoma It is not uncommon to find some mixture of these types in a single tumour Distribution may occur by the blood stream or by the lymphatics the cerebral metastases being obviously haematogenous, and the thoracic and abdominal deposits being commonly carried by the lymphatic vessels The clinical study of bronchial carcinoma shows that it tends to occur most frequently at a rather earlier age than most other cancers, the chief incidence being in the fifth decade although many cases have been described in quite young patients A clinical classification is of much help, not only in diagnosis but also when treatment has to be considered Tuttle and Womack classify bronchiogenic carcinomata according to whether they arise in a major bronchus or in a bronchiole Rabin and Neuhof group their cases into circumscribed and non-circumscribed forms Each of these classifications indicates that there is a type of tumour situated in the hilum and close to vital structures, and another, discrete, type which in the earlier stages at least is situated deep in the surface of the lobe Cough and haemoptysis are likely to be early symptoms when a tumour is related to the main bronchi, whereas the deeply situated growth may cause few or no symptoms until metastases have occurred

The clinical findings are not usually due to the growth itself but rather to involvement of surrounding structures It is common to find collapse of a lobe, or of a lung, caused by obstruction of a large bronchus When the tumour is situated under the pleura the first signs are often those of an effusion If the diagnosis of bronchial carcinoma is to be made at a stage when treatment can be effectively applied it is necessary to abandon all thought of relying on physical signs and to attempt to base the diagnosis on the combination of suspicious symptoms and judicious investigation Any middle-aged patient who has persistent cough, especially with slight haemoptysis, should be subjected to x-ray examination without delay The other investigation which is of particular

importance and which has been widely employed during the past few years is bronchoscopy and this should never be omitted when there is the slightest possibility of malignant disease Lipiodol examinations are helpful in demonstrating obstruction in the smaller bronchi which are out of reach of the bronchoscope It is as yet too early to discuss the value of tomography in the diagnosis of malignant disease The increasing safety of intrathoracic operations has made exploratory thoracotomy a procedure which should be seriously considered in suspicious early cases for it may be the only means by which a diagnosis can be made Successful treatment of bronchial carcinoma is still only to be achieved in those comparatively rare cases in which diagnosis is made at a sufficiently early stage to enable the growth to be removed The usual operation is lobectomy or even total pneumectomy and the mortality from the actual operative procedure has been strikingly lowered of recent years but it still happens only too rarely that the patient maintains freedom from recurrence for an appreciable length of time It has lately been recognized that there is a small group of cases in which a tumour of relatively low malignancy projects into the bronchus, and this type can sometimes be successfully removed through a bronchoscope The value of radiotherapy is still a subject for discussion but it appears to be definite that x ray treatment has not yet cured a proven case of bronchial carcinoma There is little reason to doubt that the duration of life has been prolonged in a considerable number of cases by the use of deep x rays and that the results are steadily if slowly improving

THE TRIAL OF MR BOURNE

On Monday and Tuesday of this week Mr Aleck Bourne obstetric surgeon to St Mary's Hospital and consulting obstetric surgeon to Queen Charlotte's stood his trial at the Central Criminal Court on a charge of unlawfully using an instrument with intent to procure the miscarriage of a girl The girl had become pregnant after being raped Mr Aleck Bourne's acquittal after a hearing which was in accordance with the highest traditions of British justice expresses the jury's view of his motive and his action—a view which will be endorsed by an overwhelming majority of their fellow-citizens It was courageous and public-spirited of him to invite prosecution in order to get the law declared on a matter of great importance to the public and more especially to the medical profession His claim cogently stated by Mr Roland Oliver, K C, was "What I have done is lawful right and honest and I have committed no offence at all" The case for the Crown put forward with moderation and respect by the Attorney General was that what he did was contrary to the law Mr Justice Macnaghten in his summing up emphasized the point that the case did not touch that of the professional abortionist

So far as the members of the medical profession themselves are concerned they alone are the persons who could properly perform such an operation It is to be hoped and expected that none of them would ever lend themselves to the malpractices of the professional abortionist No doubt they would act only in consultation with some other member of the profession of high standing so as to confirm the view that the circumstances were such that an operation had to be performed and was legal The jury having had the law expounded to them brought in a verdict of Not guilty Thus Mr Aleck Bourne has obtained the court ruling he sought and has earned the applause of his colleagues A report of the trial appears at page 199 but the medico-legal aspects of the case must be reserved for future discussion

INCOMPLETE DESCENT OF THE TESTICLE

A truly undescended testicle is an extreme rarity but the diagnosis of undescended testicle covers a multitude of degrees of incomplete descent an amended classification of which is suggested by Mr Denis Browne in his thoughtful and stimulating article on page 165 of this issue A further terminological complication in the literature of this difficult subject is that in this country the phrase ectopia testis is meant to describe a position of the testis other than in the normal line of its descent In Continental writings the term is applied perhaps more logically to any position of the testicle other than its normal one so that it usually includes cases of incomplete descent Mr Browne tilts at the custom of describing as undescended any testis that is not in the position which would be normal for an adult and he would have any position in childhood from which the testicle will invariably reach the scrotum classed as normal It may be urged that since it is normal for male children to be born with the testicles in the bottom of the scrotum any departure from that rule is abnormal and should not be classed as normal merely because in time the abnormality will right itself It may be doubted too whether most surgeons have enough prophetic insight to enable them to say that any given incompletely descended testicle will be certain to reach the scrotum spontaneously Mr Denis Browne may well be right in not taking very seriously those long lists of cases in which testicles described as being before treatment in the inguinal canal have descended into the scrotum as a result of pregnyl injections yet it is difficult to agree that 'a testis that is in the inguinal canal cannot be felt through the skin because it is a soft elongated wormlike object sunk in the soft

floor of the canal, shielded from touch by the tense tendon of the external oblique" The tendon of the external oblique is not always tense, and it allows an inguinal hernia—which one might similarly describe as a soft, elongated, wormlike object—to be felt It seems more reasonable clinically to classify non-scrotal testicles as (1) those that can be felt—which may be but are probably not in the inguinal canal—and (2) those that cannot be felt, which may be anywhere Mr Denis Browne lays valuable emphasis on the varieties of mobile testicle, in which, because of cremasteric spasm acting on a small gland, the testis, though sometimes lying in or near its normal position, is at other times much higher A large measure of agreement must be accorded to his belief that "this class supplies the greater number of the successes of pregnyl treatment" Again, in considering cases with mechanical obstruction, he stresses "the fact, still being confirmed, that cases of unilateral undescended testis average much poorer results with hormone treatment than bilateral ones," and most justifiably observes that "if one testis had descended normally it might be assumed that whatever was keeping up the other it could not be lack of hormones" Apart from the fact that incomplete descent of the testicle is usually a unilateral condition, another objection to the present wave of indiscriminate hormonic enthusiasm at which he hints is the accompanying risk of premature sexual stimulation If the volcano is activated too early may it not become prematurely extinct?

CHEMICAL ASPECTS OF ANTIGENS AND ANTIBODIES

In order to record the rapid advances that have been made in the field of immunochemistry the Medical Research Council has issued a revised edition of Professor Marrack's report on the chemistry of antigens and antibodies [1] That a second edition should be called for within such a short space of time speaks much for the usefulness of this concise and lucid account of the chemistry of antigens and antibodies and for the success that has been achieved in explaining certain immunity reactions in terms of the fundamental sciences The division of the report into five chapters has been retained, but the new edition has been extensively revised An account of the work of Svedberg and his school on the determination of the molecular weights of different proteins has been included, together with a fuller survey of the bacterial polysaccharides and a critical discussion on the relationship that has been shown to exist between chemical constitution and immunological specificity A more detailed explanation of serological cross-reactions in terms of chemical and physical structure and the important work of Heidelberger and Kendall are treated at some length by Professor Marrack and add much to the value of the report Within the last few years Heidelberger and Kendall have considerably advanced our knowledge of antigen antibody reaction by developing a theoretical treatment of the combination which appears to be in general agreement with the results of a large number of carefully planned quantitative experiments It is unfortunate that Professor Marrack did not include in the new edition an account of the recent work on the nature of bacterial antigens This work has developed rapidly during the last five years, and to-day it seems an established fact that the specific antigens of certain of the Gram-negative organisms at least are non-protein in nature Until recently it seemed probable that bacterial antigens were composed of a polysaccharide substance, with which the immunological specificity of the antigen was closely associated, combined with bacterial protein which endowed the complex with antigenic properties The demonstration of the non-protein nature of some bacterial antigens again brings forward the question why certain complexes should possess antigenic properties Large molecular size appears to be an essential characteristic of antigenic molecules, but not all large molecular complexes are antigenic It seems probable that a detailed study of the chemical and physical properties of these protein free antigens will contribute a good deal towards our understanding of the properties essential for antigenicity Workers in the field of immunochemistry and others interested in this subject are much indebted to Professor Marrack for preparing for them this reliable and up to date account of the chemical aspects of immunity reactions

THE BOOK OF PLYMOUTH

It might be said that Plymouth needs no book, for it is in itself a complete volume on the shelf of English history A statue of Drake stands on the Hoe to remind the passer-by of all that the sea has meant to England and of the greatness that has been built upon the audacity and courage of her sea captains From Plymouth Sound Sir Walter Raleigh and Sir John Hawkins sailed on their adventures—not all to end well And Plymouth has high responsibility to history because from here in 1620 the *Mayflower* sailed with the Pilgrim Fathers These things and others are set down in print in the *Book of Plymouth*, so ably edited by Mr F A Mayne, who wisely has not allowed the title to impose too strict and narrow limits on what is included in 248 pages of a book of exceptional interest He points out in some introductory remarks that both Devon and Cornwall are represented in the preparations of the 106th Annual Meeting of the B M A , and that therefore "no part of these counties" has been omitted in the accounts given by various experts on various aspects of the West Country The first part of the book is on Plymouth itself and the second on Cornwall and Devon The historical notes on the former by Mr C W Bracken are full of interest and instruction, and give the reader a clear picture of Plymouth's historical meaning Chapters follow on the medical history of Plymouth by Mr J Elliott Square, on vital statistics and municipal hygiene by Dr Mildred A Thynne, and on the water supply of the town by Mr Alan Atkinson In the second part of the book—on the two counties—special attention may be drawn to the well-illustrated chapter, "Before Written Record," by Mr R Hansford

Worth who learnedly discusses geological formations and their relation to human skeletons found in certain caves. On the other side of the River Tamar medicine says Mrs. Charles Henderson in her chapter on Cornwall has not always been held in great respect and the spirit of Molière seems to have dwelt in the writer of the fifteenth century verse play of the Life of St. Meriasek in this the doctor confides to his dispenser that

> If falsehood helps not
> A physician will never rise

The same standard of excellence and interest is maintained in the other chapters and we would finally refer to the pictorial maps of Devon and Cornwall by Colonel M. Orr Wilson which form the end papers of the volume and to the delightful photograph of Dr. Colin D. Lindsay the President.

THE BIRMINGHAM MEDICAL SCHOOL

The opening of the Hospitals Centre at Birmingham which was the subject of an article in our last issue is the occasion for the publication of a booklet by the Faculty of Medicine giving a short history of the Birmingham School and an account of its new buildings and environment. Systematic clinical instruction of medical students in Birmingham goes back to the opening of the General Hospital more than 150 years ago. The foundation of the School of Medicine proper was the work of William Sands Cox, the son of a Birmingham surgeon who qualified in 1824 and in the following year began a course of Anatomical Lectures with Physiological and Surgical Observations with a class of nineteen students. The school was astonishingly successful. By 1835 it had ninety students and a panel of lecturers and in 1836 William IV. became its patron and decreed that its style should be the Birmingham Royal School of Medicine and Surgery. Afterwards Queen's Hospital was established as an institution primarily for the teaching of students and when Queen Victoria granted a charter to the school in 1843 it became known as Queen's College. In 1851 a rival school Sydenham College was founded in association with the General Hospital and was administered by local practitioners. Presently steps were taken to amalgamate the two schools. This was successfully accomplished and the Birmingham Clinical Board was founded to co-ordinate the clinical teaching at the two hospitals—that is, the General and Queen's. The school owes a great deal to Joseph Mason, one of the self-made men of Birmingham at whose college the students of Queen's took their preliminary science training. In 1892 when there were upwards of 250 medical students the Medical Faculty of Queen's became the Medical Faculty of Mason's College. The booklet goes on to describe the advent of the Hospitals Centre Scheme and the planning of the new school buildings which are an integral part of the enterprise. A remark is made on the apparent anomaly that there is no provision for the teaching of medicine and surgery in the school itself: this is deliberate: the Faculty of Medicine believing that these subjects should be taught in the hospital. It is proposed as soon as the school is in working order at Edgbaston to set up three research departments—namely, in industrial hygiene, cancer and mental diseases. The school is provided with a large department for dentistry and all dental instruction, including that which has up to now been given at the Dental Hospital, will in future be given in the new buildings. The number of medical students taken each year will only be sixty-six, a slight increase on the present entry limit of sixty; but facilities will be available for the admission of a certain number of students in excess of that figure when they have finished their pre-clinical studies elsewhere—for instance at Oxford or Cambridge—and wish to take up clinical work in Birmingham. It is also proposed at a later date to make arrangements for postgraduate study seeing that the clinical material available in the city and surrounding areas is exceptional both in its size and range. When the new hospital has its full complement of beds (740) one of the other general hospitals in the city will probably be reserved for postgraduate study. The booklet is an interesting souvenir ably written and includes an aerial photograph of the new buildings and site.

ELECTROCARDIOGRAPHIC CHANGES DUE TO SMOKING

The advice he receives on smoking is to the patient with heart disease a most important aspect of his treatment since very often he has been a heavy smoker and finds drastic reduction hard to carry out. It is generally agreed however that smoking is apt to increase blood pressure and the frequency of the heart beat and cause a dry cough all of which are better avoided in cardiac disease. The patient is therefore usually advised not to smoke at all or at most a little after meals—a restriction which he finds difficult to follow as the habit is usually ingrained and pleasurable. More precise observations of the effect of tobacco smoking on the heart are supplied by A. Graybiel, R. S. Starr and P. D. White[1] who have investigated the electrocardiographic changes in forty-five subjects four of them being non-smokers and the majority tobacco addicts eleven had heart disease. After a control electrocardiogram and other records had been taken the smoke from a cigarette was inhaled until toxic symptoms appeared or it was finished. In some cases two or three cigarettes a pipe or cigar were smoked. During the test twenty-eight complained of symptoms—cerebral cardiac or gastro-intestinal. The electrocardiogram showed changes apart from those of rate in twenty of the forty-five subjects seventeen being heavy smokers and three moderate or non-smokers. The commonest change was a decrease in the amplitude of the T wave in Leads I and II and in one instance T became negative or diphasic: flattening of the previously well-developed positive T wave was not infrequent. In a few cases atropine sulphate (2 mg. intravenously) was also tried, and the effects on the tracing were found to be very similar to those of smoking. Discussing the way these changes are brought about Graybiel and his colleagues

Amer. Heart J. 1938, 15, 89

state that only three toxic substances need be considered—pyridine bases, carbon monoxide, and nicotine They believe that neither carbon monoxide nor pyridine bases are usually absorbed in amounts capable of inducing the changes recorded, and hold nicotine responsible for them all Some of the effects—for example, the increase in pulse frequency and in blood pressure, which occurred in the majority—may be attributed to stimulation of the sympathetic nervous system, but there is less evidence that the changes in the T wave were brought about in this way, though it was noted that they were conspicuous in the young and healthy but emotionally labile subject and absent in the more stolid, even with severe coronary disease Amyl nitrite was without effect on the altered wave, and the authors do not regard the changes in the T wave indicative of coronary vasoconstriction They believe that any aggravation of angina pectoris caused by smoking is due not to an action on the coronary arteries but to the well-known action of nicotine on the frequency of the heart and on the blood pressure, which are usually both increased

HARVEY CUSHING

We welcome to this country Dr Harvey Cushing, emeritus professor of surgery, Harvard University, and congratulate him on the honorary degree of Doctor of Science which was conferred on Saturday by the University of Oxford Dr Cushing has many ties with this country, for in his early days he worked in several laboratories of physiology here During the war he came in contact with many surgeons of the British Army In the course of his long tenure of the professorship of surgery at Harvard he built up his world-wide reputation as a peerless operator on the central nervous system, and inculcated his methods into men from all over the world Eminent not only in surgery, he has distinguished himself also in the field of letters and his biography of Sir William Osler will remain a monument to his literary style and his appreciation of the spirit and achievement of a great man It is only right that the biographer of the late Regius Professor of Medicine at Oxford should be honoured by the University which Osler graced during the latter part of his life Those who have worked with or been acquainted with the "Chief" have always been impressed with Dr Cushing's surgical skill and his knowledge of literature, and, more particularly, with his wisdom and understanding of patients in his care He has not only a genius for making friends but that greater genius of being able to keep them

SUCCESSFUL VACCINATION WITH DEAD TUBERCLE BACILLI

Some unusually successful results from vaccinating guinea-pigs with dead tubercle bacilli have been obtained by G Hensel [1] Twenty-one animals were inoculated, presumably subcutaneously, with 0 005 gramme of tubercle bacilli suspended in 1 c cm of lanolin or soft paraffin The organisms had been killed by exposure for two hours to a temperature of 65° C Ten to eighteen months later, when still tuberculin-positive, the animals were injected intracutaneously into the hind leg with 0 00001 mg of living tubercle bacilli from a four-weeks-old culture Ten control animals received the same infecting dose simultaneously Cultures put up from the inoculum showed that living tubercle bacilli were present Three months later all the animals were killed In the control group the focal glands were enlarged and partly caseous, and in nine out of the ten animals the spleen was obviously tuberculous In the vaccinated group, with one exception, not a single animal showed any lesions in either the glands or the spleen Examination of the vaccination site showed the presence of a capsulated lesion containing apparently unaltered vaccine material with intact acid-fast bacilli Only in the animal showing tuberculosis had the lesion developed into an abscess and discharged part of the vaccine material The reasons for the extraordinarily successful result of this experiment are discussed The author lays stress on the long period of allergy—ten to eighteen months—elapsing before infection, on the smallness of the infecting dose used and on the choice of the intracutaneous route for infection which ensured that the living bacilli gained access to the tissues slowly

[1] *Beitr klin Tuberk* 1938 91 442

NATIONAL RADIUM TRUST

The National Radium Trust met on July 12 at the Privy Council Office, with Viscount Hailsham, Lord President of the Council, in the chair The Earl of Donoughmore was reappointed for a further period as chairman of the Radium Commission (the expert body set up under the Charter which allocates the Trust's radium and supervises it in use) Various matters were reviewed affecting the supply of radium to the Trust The Trust, £150,000 of whose funds was contributed by public subscription in 1929 as a thank-offering for the recovery of his late Majesty King George V, welcomes gifts and bequests of all kinds in furtherance of its objects, including trusts subject to special conditions, which it is expressly authorized to accept under the Royal Charter granted by King George V in 1929 Its headquarters are at the New Public Offices, Whitehall, S W 1

THE HALF-YEARLY INDEXES

The usual half-yearly indexes to the *Journal* and to the *Supplement* and *Epitome* have been printed, they will, however, not be issued with all copies of the *Journal*, but only to those readers who ask for them Any member or subscriber who wishes to have one or all of the indexes can obtain what he wants, post free, by sending a postcard notifying his desire to the Finance Department, British Medical Association House, Tavistock Square, W C 1 Those wishing to receive the indexes regularly as published should intimate this

At the quarterly meeting of the Council of the Royal College of Surgeons of England held on July 14, Mr Hugh Lett, F R C S, consulting surgeon to the London Hospital, was elected President for the ensuing year

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

INJURIES TO THE ELBOW-JOINT

BY

S. L. HIGGS, F.R.C.S.

TENNIS ELBOW

Much has been written but little is known with certainty about this common minor ailment. It is an annoying condition not only to the patient but also to the doctor as treatment so often fails to effect a cure with consequent dissatisfaction to all concerned.

Diagnosis

The condition may sometimes be mistaken for arthritis of the elbow or some other painful disorder but the diagnosis may be made in a few moments as the signs and symptoms are definite and vary but little. The patient complains of pain at the outer side of the elbow and sometimes down the forearm on gripping with the fingers as in shaking hands or opening a door and on such movements as lifting quite small objects—a teapot or even a tumbler. Tennis and other games requiring a firm grip become impossible.

On examination the appearance of the arm is quite normal. The elbow should be moved passively with the muscles relaxed. No pain or stiffness is experienced so that the joint itself is thereby excluded as the site of the trouble. On active extension of the wrist against resistance especially if this movement is combined with supination the typical pain occurs. If this active extension is maintained the site of the pain can be localized. There are three usual situations all of them beneath the common origin of the extensor supinator group of muscles. The first and most usual is over the radio-humeral joint the second rather higher up in the region of the external epicondyle, and the third and least frequent rather more forward beneath the bulky part of the muscle origin. The moment the active contraction is relaxed the pain disappears. An exactly analogous condition is very occasionally found on the inner side of the elbow just below the tip of the internal epicondyle at the origin of the flexor pronator group of muscles.

The condition is rarely seen in patients under 35. The trouble is provoked by vigorous use of the arm as in playing tennis fly fishing and gardening. Although sometimes seen in industrial workers it is the occasional overuse as in games rather than regular activity which seems to determine an attack. There is often a history of rheumatism lumbago sciatica and so on suggesting that an infective factor may be at work. Frequently the history is given of a tennis elbow lasting two or even three years, but rarely longer. The trouble seems to run a certain course and then to disappear spontaneously.

These observations seem to throw some light on the nature of the disorder and to indicate the line of treatment. When the elasticity of youth has passed and at an age when focal sepsis is common unaccustomed vigorous use of the forearm muscles may lead to trauma to their deep fibres of origin. Instead of clearing up in the manner of an ordinary strain the painful symptoms persist owing it may be supposed to a low grade infective process becoming established in the damaged tissues. In a case explored by operation eight weeks after the onset of the trouble a patch of granulation tissue was discovered—an observation which lends support to this theory.

In course of time the active stage of inflammation passes into one of fibrosis and adhesions and ultimately the lesion heals and symptoms disappear. In these later stages a chronic inflammatory area resembling ash-leather may be discovered at operation.

Treatment

The multitude of methods that have been advocated only indicate the uncertainty of the results. Many patients are seen who have already tried a number of remedies—massage bone setting and the like—and are disappointed at their lack of success. Some account of the nature of the trouble should therefore be given and its chronic character and ultimate spontaneous recovery explained. The advice however will depend on the duration of the trouble when the patient is first seen.

At the onset or if it has been present for a few weeks only it is sometimes possible to cut short the attack by rest heat and avoidance of the painful movements. The arm should be kept in a sling and heat applied by antiphlogistine at night. In addition diathermy may be given. The elbow joint should of course be moved through its full range each day to prevent stiffness but the forearm muscles must be kept out of action. Focal sepsis should be sought and an x-ray examination of any crowned dead or suspicious looking teeth carried out and apical infection dealt with if discovered. Massage movements and electrical stimulation appear to make matters worse rather than better and should be avoided. Most patients do not seek advice at the early stage but only when the condition has been present for some months.

In the early chronic stage which may last a year or more treatment is most difficult. This is rather to be expected if we believe that a localized chronic inflammatory process is at work. During this period there is no actual contracture of the affected muscles and this would explain the frequent lack of success of rapid manipulative methods. It should be pointed out that a very certain cure within a short space of time can be effected by means of an operation. The majority however will not welcome this suggestion as they regard a tennis elbow as a minor nuisance not worthy of such drastic treatment. Nevertheless there are some who find a disabled arm such a hindrance to sport or work that they will agree to operative measures especially when other means have failed and for them a speedy cure is assured.

The Operation

The whole arm is given the usual thorough preparation. Then to render the operation field bloodless an Esmarch bandage is bound round from the hand upwards and finally made fast by a few turns about the middle of the upper arm. The lower part of the bandage is then unwound and the elbow held in mid-flexion with its inner side resting on a sandbag. In no circumstances

may the rubber bandage be kept on for more than half an hour, but far less time than this should be sufficient

A slightly curved incision four inches long is made on the outer side of the elbow behind the external epicondyle In this situation the resulting scar is hardly noticeable The skin is retracted forwards and then the muscles of the extensor-supinator group are reflected from the epicondyle and the capsule of the radio-humeral joint In some cases definitely pathological tissue is visible beneath the muscles No special search is made and since the object is not so much to remove anything but to relieve tension the muscles are stitched back again with a few interrupted No 0 catgut sutures It is as well to take off the Esmarch bandage and pick up any bleeding points before sewing up the skin The arm is kept in a sling until the stitches are removed one week after the operation, and then gradual return to active use is allowed The arm is usually strong and comfortable once more by the end of a further two weeks

For the majority of patients other measures must be tried Success, by operation or otherwise, is achieved by relieving tension at the painful muscle origin, and the method described by Cyriax is giving promising results, treatment can be carried out by a masseuse familiar with the technique The patient's elbow is flexed to a right angle and fully supinated Deep friction is then applied to the muscles in front of the external epicondyle over the tender area This is continued for four or five minutes after which the elbow is extended in full supination and the forearm adducted forcibly Some "cracks" may or may not be elicited The treatment is carried out three times a week, and in a short time relief should be experienced if the method is going to be successful

In the late chronic stage where adhesions have formed a tennis elbow can usually be cured in a dramatic manner by a single manipulation The suitable case can be detected in the following way The fingers and wrist are flexed and the forearm pronated The elbow is then extended By these means the affected muscle group is put on the stretch If the range of extension is limited and causes pain at the elbow we may assume that contractures have formed and that the case will respond to forcible stretching The manipulation (Mills's method) can be done without an anaesthetic, less painfully after an injection of 2 c.cm. of 2 per cent novocain into the area of maximum tenderness, but best of all under anaesthesia from gas or from an evipan injection Only a moment's relaxation is required The muscles are put on the stretch in the manner described With one hand the operator grasps the flexed fingers and wrist, and with the other the elbow, placing his thumb behind the radio-humeral joint The elbow is then forcibly extended and simultaneously the flexion of the hand and pronation of the forearm are increased to the full extent A "crack" is usually heard and felt in the region of the muscle origin at the elbow No after-care is necessary, and the patient should be encouraged to resume active use of the arm

DISLOCATIONS AND SPRAINS

Next to the shoulder-joint the elbow is most frequently dislocated Unlike the former it occurs more often in children than in adults It is an injury fraught with serious consequences because of the great damage that inevitably occurs to the ligaments and their periosteal attachments and to the neighbouring muscle insertions By far the commonest type is the posterior dislocation, due to a fall on the outstretched arm, causing hyperextension at the joint and levering of the coronoid process backwards over the articular surface of the humerus More rarely the elbow is displaced sideways, either inwards or outwards, but this is usually accompanied by fractures Anterior dislocation is rare

The diagnosis is as a rule quite obvious from a consideration of the deformity and position of the bony points What is not so evident by clinical examination alone is whether or not there is associated bony injury An x-ray examination is therefore most necessary for the purpose of both treatment and prognosis If, however, x-ray apparatus is not available, then to avoid delay and suffering the elbow should be reduced, but radiographs must subsequently be taken Frequently, in a posterior dislocation, a fracture of the coronoid process or radial head will be revealed and in a lateral dislocation more serious fractures involving the condyles may be seen

Treatment

In fresh cases reduction is easy, the ligaments and soft structures being so torn that little resistance is offered except by the bony contours It is more satisfactory in every way for the reduction to be carried out under a general anaesthetic, affording good relaxation and ample time In a posterior dislocation the coronoid process of the ulna which has slipped back beneath the lower end of the humerus, must be made to retrace its path An assistant steadies the upper arm, and the forearm is grasped and pulled firmly but gently in the line of the limb If the dislocation is of several days' duration, or difficult to reduce, then hyperextension will lever the coronoid process over the humeral surface and the joint will be felt to slip back into place The arm is then put up in fairly full flexion, but as the swelling may give rise to pressure symptoms this must not be overdone or forced A period of rest in the flexed position is most necessary, not only to allow the swelling to subside, but also to prevent recurrence of the displacement to save the torn ligaments from further trauma during the first stage of repair A sling, with early movement, is not a wise line of treatment It is better to immobilize the elbow in a moulded plaster A four-inch or six-inch plaster bandage, depending upon the size of the arm, is immersed in water and, keeping it wet, a "slab" of the requisite length from upper arm to wrist is prepared It is then put on straight over the skin to the back of the upper arm, elbow, and forearm and as it sets it is fixed in position by a lightly applied domette bandage This should leave the elbow region free in front, in order to prevent pressure and provide for inspection of any swelling The whole is supported by a sling In uncomplicated cases this splint should be retained for a fortnight and then replaced by a collar-and-cuff sling for a few days until the elbow gains the position of a right angle This is followed by an ordinary sling for at least a further week

The complications to be feared are the formation of new bone around the joint at the site of the torn up periosteum, ossification in the ligaments, and myositis ossificans in the tendon of the brachialis anticus The danger of these may be reduced but not eliminated by careful treatment, and therefore when the case is first undertaken it is advisable to inform those concerned of these possibilities-and to record them in writing

During the period when a sling is worn and also later when it has been discarded, restoration of movement should be left to the patient's own efforts Massage,

stretching and forcible measures of any kind must be absolutely forbidden as such misguided attempts instead of hastening matters may only lead to further trauma and increased stiffness and even to periarticular ossification that would otherwise not have taken place Return to normal movement is usually slow but no anxiety need be felt provided that the range steadily improves Should this become stationary or the stiffness increase then an x-ray examination must be made to determine whether ossification is occurring in the neighbourhood of the joint

Treatment of Complications

The radiographs may show a shadow above the coronoid process of the ulna indicating the onset of myositis ossificans in the brachialis anticus muscle Complete fixation of the joint for a long period is essential This is best carried out by applying a wet plaster slab direct to the back of the arm with the elbow flexed to a right angle the plaster being held in place by an evenly applied bandage Finally a few turns of a plaster bandage surround the whole In this way immobilization is assured, with maximum strength and minimum weight of plaster The hand is left free and can be used At intervals of one month fresh radiographs are taken after removal of the plaster case in order to observe progress The extent of the ossification continues for a time reaches a maximum and then begins to wane It may be six months or more before the condition becomes stationary and during the whole of this time the plaster fixation must be continued Absorption of the new bone is rarely complete Usually a branch like growth of well defined bone persists The elbow is given its freedom but no treatment is desirable With time and active use a certain range of movement will return In most cases this range is adequate but not complete If, however the limitation is serious even after a full six months of activity and it is clear that the bony growth has formed a block then this should be removed by operation Too early surgical intervention will only lead to recurrence of the ossification so patience and careful judgment based on the x-ray findings are necessary

Ossification in the ligaments or bony spurs at the periosteal attachments also require rest and avoidance of any form of irritation by massage or by passive movements Complete immobilization in plaster is not necessary, but a sling should be worn for a month or more until there is radiographical evidence that the new bone formation has ceased

Treatment of Old Dislocations

Although reduction of a dislocation is very easily accomplished soon after the injury with every day's delay it becomes more difficult In these old unreduced cases another method must be employed as *forcible stretching* with the elbow in extension may not only fail to effect reduction but may also cause further injury to the soft tissues To obtain the necessary purchase the upper arm is attached by means of a loop of broad firm bandage to a radiator or to some fixed point on the wall Strong traction is then applied to the fingers and thumb with the elbow bent at a right angle It is difficult however, to get the necessary grip and Bohler's method of applying the pull through gauze stuck to the patient's fingers and thumb with 'mastisol' is most valuable By these means steady force can be applied and the coronoid process of the ulna made to retrace its path beneath the lower end of the humerus The after treatment by a period of fixation followed by increasing activity is the same

Reduction by open operation is rarely either necessary or satisfactory as it entails so much soft part injury and subsequent stiffness

Sprains

A sprained elbow should not be regarded so lightly as a similar injury to other joints An x-ray examination is advisable since the general swelling and stiffness may conceal a fracture of the head of the radius or other bony damage neglect of which may lead to serious consequences Strapping active use and physical treatment may suffice for other sprains but in the case of the elbow rest and an unhurried and unaided return to activity is the right policy It cannot be too strongly emphasized that stiffness must not be treated by manipulation, massage or forcible stretching

LONDON FEVER HOSPITAL

OPENING OF THE NEW BLOCK

H R H the Duke of Kent on July 14 opened a new isolation block which has been added at a cost of £111,000 to the London Fever Hospital in Islington This replaces an older building which was in its time extremely up to date isolation block in the world

The New Isolation Block

The new building different from the old in almost every respect is the result of many years experience of fever hospital administration It is a three storey structure with seventy three beds so designed that each patient is isolated and it will act principally as a clearing house for incoming patients whose symptoms have not been clearly defined Doubtful cases will be observed until they can be placed in their appropriate category when they will be transferred to the corresponding ward There may also be patients with more than one disease who will need single room accommodation

Each of the three floors of the block has a wide veranda in front continuing around both ends of the building and forming a service corridor behind thus there are no closed spaces which in old fashioned buildings were responsible for a certain amount of room to room infection Except for the top floor with its two four bedded wards each floor is of the same design arranged in single rooms The rooms are separated by glass partitions which give the nurse a view of the whole length of the floor from the central kitchen though curtains afford privacy when necessary for adult patients A portable bath sink enables each patient to have a bath in his own room Each patient has his own thermometer torch spatula basin treatment tray and doctor's nurse's and visitors gowns The washing and sterilizing plant in the central kitchen is cast in one piece of stainless steel The crockery is washed in one sink, and after rinsing transferred in specially designed racks to be sterilized in a steam jacketed tank There are many such interesting contrivances and safeguards in this modern building

History of the Hospital

The London Fever Hospital was the first voluntary fever hospital in this country and is still the only one of its kind in the London area It was formed as a result of the deplorable social and hygienic conditions which existed in London 140 years ago Like many other movements of the time it originated in a tavern—the Thatched House Tavern—where a meeting of citizens was held in 1802 to institute means of dealing with the contagious diseases then so prevalent Its original home was in Gray's Inn Lane after which it moved to a site now occupied by King's Cross station It has been on its present site in Islington for

nearly ninety years During the first half of the nineteenth century the hospital was closely associated with the pioneer work of those men and women who fought to awaken the country to the appalling housing and sanitary conditions then existing Southward Smith one of the leaders in the agitation which led to the passing of the first Public Health Act in 1848, was a physician of the hospital Among the friends of the hospital who brought it into public notice were William Wilberforce, Florence Nightingale and Charles Dickens the last named in 1861 wrote a vivid account of the hospital in *All the Year Round* It was as the result of a series of confirmatory tests and observations at this hospital that Edward Jenner's discovery that vaccination with vaccinia lymph was a protection against small-pox was finally accepted by the medical profession, it was here also that Sir William Jenner, working at a table which is still preserved, established the clinical differentiation of typhus from typhoid fever

The hospital receives patients from all parts of the country, and its local character has long since disappeared Up to now it had suffered under the handicap that the public regards infectious diseases as a matter for the local authorities, and 'fever' has not the appeal of some other afflictions It has had great difficulty in raising money for its work, and this new extension is financially rather a venture of faith

Opening Ceremony

The Duke of Kent was received by Field Marshal LORD MILNE the president of the hospital, who referred to the special difficulties under which a fever hospital had to carry out its work When the life of a fever patient was saved by sound diagnosis and skilled medical attention and nursing little was said of it and few people were inclined to visit a patient unless it was their plain duty to do so, a very different state of affairs from what happened when a life was saved by surgery The result was that too few people heard of the work of the London Fever Hospital, and no spectacular gifts came its way Of the £30 000 required to build a new isolation block £20,000 had still to be found

The DUKE OF KENT praised the design of the new building, whereby the possibility of infection from patient to patient was completely avoided The hospital provided facilities which were not given in the ordinary fever hospitals, and admitted all cases of infectious diseases except small-pox His Royal Highness added a special greeting to the patients, to whom the opening ceremony was relayed

Sir WILLIAM WILLCOX speaking to a vote of thanks to the the Duke of Kent, said that the special isolation block had been desired by the medical staff for many years He gave a brief outline of recent progress in the treatment of infectious diseases There was now he stated, a reasonable hope of stamping out diphtheria by the preventive inoculation of healthy children with the diphtheria toxoid Municipal authorities were beginning to establish immunization clinics against the disease a movement worthy of every encouragement At the hospital there had been virtually no deaths from scarlet fever for several years The mortality for measles was now seven times that for scarlet fever, and during the past year over 1 000 had been completely protected from measles by the use of the preventive serum prepared at the hospital from convalescent patients

---

The International Labour Office decided in 1935 to publish a supplement to *Occupation and Health* which was an encyclopaedia of hygiene pathology and social welfare issued by the Office in 1925 The first instalment of the supplement has now been published and consists of brochures on (1) allergy and occupation (2) asbestos (3) beryllium (glucinium) (4) pneumoconiosis and (5) silicosis A special loose leaf binding cover will be offered to subscribers to the supplement The subscription rate for 500 pages including the cover is £1 and orders may be addressed to the International Labour Office at 12 Victoria Street London S W 1

MEDICAL STUDENTS' CONFERENCE

THE TRAINING OF THE DOCTOR

A medical students' conference under the auspices of the National Union of Students, was held in London from July 12 to 15, when the general subject of discussion was "The Training of the Doctor" The conference was preceded by a dinner at which Lord Horder was the principal guest At the end of the conference visits were paid to the Pioneer Health Centre at Peckham and to three London hospitals—Middlesex, Royal Free, and University College—where special demonstrations were arranged for the benefit of the students The conference was attended by delegates from all the universities in Great Britain and Ireland

The Medical Curriculum

The first address was given by Sir HENRY BRACKENBURY chairman of the British Medical Association Committee on Medical Education He began by referring to four important documents on the subject issued during the last few years These were in chronological order, a volume entitled 'Medical Education'—an exhaustive study principally of the conditions in the United States—a valuable treatise compiled by the Health Section of the League of Nations the report of the British Medical Association committee and a report by a body representing the Universities and Royal Colleges The last named was compiled by teachers only, the B M A report by a composite committee

Sir Henry Brackenbury described in detail the attitude of the General Medical Council towards the proposals in the B M A report Four main suggestions came forward (1) that the standard of general education for admission to the profession should be raised, (2) that the preliminary scientific requirements should be widened (3) that departments in medical schools should not be segregated, and that more attention should be paid throughout to the preventive aspects of medicine and to the living body rather than the cadaver and (4) that there should be a period of responsibility under supervision at the end of the training but included in the medical course *Some of the B M A suggestions had been* implemented though imperfectly, by the General Medical Council others had been negatived including the suggestion that it was not necessary that dissection of the whole cadaver should be undertaken by every medical student The B M A committee believed that a knowledge of the human frame could be taught partly by dissection by the students on a part of the cadaver, but also by demonstrated dissection by some more expert hand specimens in museums, and, above all demonstrations on the living human body One surgical member of the B M A committee, indeed had held that dissection was of no use at all because what had been learned in dissection had to be unlearned in operative surgery The objection to the dissection of the whole cadaver, on which the General Medical Council insisted was that it took a great deal of time which might be saved during the first two years of the curriculum Another important suggestion was that at the end of the student's training before registration six or perhaps nine months should be passed as a period of responsibility under supervision following which there would be an oral examination on that experience only This was being pressed and he fully expected that at the next revision an arrangement somewhat on those lines would be introduced

The Teaching of Psychology

During the ensuing discussion a good deal of interest was evinced by the students in the teaching of psychology Sir Henry Brackenbury in reply to questions said that the demand for the inclusion of the teaching of psychology in the first two years in connexion with physiology and in the clinical years in connexion with medicine came very emphatically from the students themselves The longer a man was in practice the more aware he became of the paramount

importance of the teaching of psychology in its clinical aspects But such instruction was very difficult—some teachers said impossible—first because the student by the mere fact of his youth had not sufficient experience to appreciate psychological problems and again because the actual treatment of persons with psychoneuroses had to be conducted in seclusion so that it was difficult to introduce even a small body of students Both these were formidable obstacles but he believed they could be overcome by proper teaching and wherever effective teaching of this kind had been introduced to judge from the earnest attention given it was the most popular course of all

Pre-clinical Subjects

Professor C A Lovatt Evans addressed the conference on the relation of pre-clinical subjects to the medical curriculum as a whole He began by quoting Stephen Leacock to the effect that if he founded a university the first thing he would do would be to establish a smoking room then a dormitory and afterwards when funds permitted a decent reading room and library finally going on to get some textbooks and hire a professor This was his way of suggesting that the essential thing in university education was contact with other people particularly those studying other subjects British medical education said Professor Lovatt Evans was still one of the outstanding trainings in the world Other countries might have longer or more specialized courses or on paper more searching requirements or examinations but the fact remained that medical education in Great Britain was of as good general standard as in any other country and better than in a good many

Were all the pre-clinical subjects essential to medical education? Of late there had been a good deal of talk of the need for a more vocationally directed training with rather less of pure science Was this claim at all justified? People like himself who were educators had to examine themselves as to whether the students coming to them had the right sort of preliminary education whether they were the right sort of student whether they were too numerous or too few Was there any means of knowing at an early stage whether a student had an aptitude for medicine or not? He felt there was some room for improvement in the opportunities offered at school before entering the medical curriculum Many lads who made their way to the university nowadays had been forcibly fed in their education with a view to getting matriculation or a scholarship at an early age with the result that their general culture suffered Although a fair proportion of students at the Intermediate showed a reasonable standard of literacy far too high a proportion had a standard so low and shocking as would be a disgrace to any child of 11 or 12 and of average mentality It was clear that such students had an unsuitable early education or were intellectually unfitted to enter the profession Examiners had a duty to the public to the profession and to the candidates themselves to keep such candidates from going on into a profession to which they would be no credit

Too Many Students in Medicine?

Professor Lovatt Evans went on to ask whether there were too many students in medicine Up to the present it seemed that those entering were absorbed but in all countries there were now twice as many students as there were before the war and in some countries the greatest increase had been in medicine It would be very serious to have an unemployed professional proletariat Was there any way of finding out early whether students had a right aptitude? Aptitude tests had been devised in the United States to estimate a candidate's adaptability by trying to find out what remained to him after most of the forgettable things had been forgotten and also to test his ability to work under pressure A special mental aptitude test which had been devised showed that most of the medical students could pass the test very much better than students in other branches of learning

He discussed the pre-clinical subjects one by one and came to the conclusion that all of them were necessary What about biology for example? It should not be forgotten that many of the ills which afflicted or threatened the world were products of the supremacy of the exact sciences whereby the hopes of mankind were based upon the possible rescue by comparable advances in biological science meaning sociology economics ethics perhaps heredity and race purity but free from political claptrap of all kinds He believed that the subject matter of all pre clinical subjects was so ample that all of them could be and usually were arranged so as to provide a maximum of all that was educationally desirable and vocationally useful Anatomy was of the same absolute importance as in former years but of less relative importance and in the University of London half the student's time was now given to the physiological group In the sense that the anatomy now taught was of the living body rather than of the cadaver there has been an advance in anatomical teaching. He regarded the physiological group—biochemistry biophysics experimental physiology and pharmacology—as representing the central point of pre-clinical education In this group the human body was studied along dynamic lines and if this teaching sunk deep into the student's spirit gave him a new outlook on life

The practice in some foreign countries had been deliberately to sacrifice the training of the general practitioner to the interests of the man who intended to devote himself to research Professor Evans thought that was wrong but in this country the curriculum was not as well adapted as it might be for the research worker Possibly two curriculums could be devised—one for the research worker on the scientific side and the other for general practice but nothing should be done to make it difficult for a practitioner who found that he had talent or opportunity to practise research to indulge his bent Some valuable pieces of research had been carried out in the absence of special facilities by general practitioners At the present time there was too much money available for the doing of research and not enough for the training of men to do it

Adequacy of the Curriculum

Mr Epic Pearce Gould in addressing another session of the conference said that he held that there was no profession which made the same contribution to individual and collective well being as did the medical profession nor was there an industry which made the same demand upon a man's memory his general level of intellect his kindliness of heart his understanding of human nature and his readiness to adapt himself to changing conditions and advancing knowledge If this was so it must follow that only those who were by Nature endowed with considerable intellectual gifts were fitted to take up the medical profession There were already upwards of 60,000 names on the *Medical Register* and during the last five years the average annual rate of increase was 1,800 The medical profession was bound because of the need for numbers to accept a standard lower than that which might be considered as ideal Thus it would appear that the curriculum nowadays was designed not so much to ensure a high standard as to see that the standard was not too low

Mr Pearce Gould went on to discuss the various grounds on which in his experience the curriculum was criticized—namely that it was too full that the teaching was too much in the hands of specialists that specialists took an undue part in examinations that no instruction was given during the curriculum in the art of practice and that too many people were ploughed in examinations As a member of a conference which had considered the whole subject, he had come to the conclusion that it was out of the question seriously to lighten the curriculum One had no choice but to accept the inclusion in the curriculum of some instruction in every branch of the practice of medicine and the ancillary sciences on which that practice was based Unless the students were given a very wide view not only of the fundamentals but of the widening avenues of actual practice they could not be given the background which enabled them to grasp the subsequent advances He declared

that candidates did not get 'ploughed' in surgery because they were not surgeons They ploughed themselves because they had not learnt to appreciate the fundamentals of just that part of medical practice which happened to have a surgical value He desired to see in all examinations in anatomy and physiology actual physicians and surgeons sitting in the examinations with the professors in those subjects

Teaching the Art of Practice

The difficulty in teaching the art of practice Mr Pearce Gould continued was to find the right type of man to give the right type of instruction Surely the art of practice was something which could not be taught The difficulty of the examiners was to decide whether the candidates were fit the very next day, to go out and assume the rights and responsibilities of qualified medical practitioners That being so, quite a heavy proportion of people were bound to be ploughed"

One woman student from Birmingham University in the discussion, mentioned the value of lectures on national health insurance practice, which had been given in Birmingham by Dr Guy Dain Mr Pearce Gould said that it would be a matter of machinery for the Ministry of Health to prohibit any qualified practitioner from going on the insurance panel until he had received such instruction But in his view the art of practice was much wider than learning the regulations of such a system as national health insurance It was fairly easy to give such instruction because it was all cut and dried He held that one could not really teach the coming doctor how to handle people how to evaluate those outside conditions which had a bearing not only on diagnosis but also on treatment how to talk to patients, how to judge whether someone was telling the truth or his motive in withholding it how much sympathy to express and when to adopt if necessary a dictatorial tone

In reply to another student speaker who complained that the curriculum was too full Mr Pearce Gould said that he saw a good deal of medical students and noticed very little sign of serious overwork The curriculum as prescribed was only a daytime thing The student had his evenings and week ends, and he thought it required only a moderate degree of industry to get through the necessary reading

One male student declared that if the profession was equally open to both sexes in all the medical training schools it would be possible to enlarge the scope of student material by bringing in numbers of intelligent people (women) who were able to make good doctors in due course

The final event of the conference was a general discussion on preventive medicine which was opened by Professor W W JAMESON

At a meeting of the last court of directors of the Society for Relief of Widows and Orphans of Medical Men, with Mr V Warren Low president in the chair three new members were elected Grants amounting to £2,423 were voted for the half yearly payments to the widows and orphans in receipt of relief. Included in this sum was one of £78 for special grants to enable three orphans to study for professional careers A gift of three articles of jewellery and two small Dutch paintings had been received from the executors of the late Mrs Braley Thomas A widow of a deceased member applied for relief and she was voted an annual grant of £50 from the ordinary funds and one of £25 from the Bricknell Fund It was decided that the proposed dinner to celebrate the 150th anniversary of the foundation of the society should not be held The directors desire to bring to the notice of medical men the great advantages that may accrue by joining the society Membership is open to any registered medical man who at the time of his election is residing within a twenty mile radius of Charing Cross Relief is only given to the necessitous widows and orphans of deceased members Full particulars may be obtained from the secretary 11, Chandos Street Cavendish Square W 1

Mr Harold Kisch F R C S

Ungrouped
Lord Annaly
Mr J Swift Joly F R C S
Capt Robert Whitney

Atmospheric Pollution

Twenty-four representatives of local authorities and other organizations co operating with the Department of Scientific and Industrial Research in investigations into the nature and extent of atmospheric pollution met recently at the offices of the Department Alderman D Adams, M P of Newcastle presided over the conference, which has now been meeting regularly for ten years It was reported that during that period there had been a marked increase in the number of places at which observations of deposited and of suspended matter were being regularly made by co operating bodies, and that in addition a continually growing number of regular observations were now being made of sulphur gases in the atmosphere by methods which had since been introduced The conference expressed strong belief in the importance of continuing and extending the investigation in order to provide the assured basis of fact necessary for determining the nature of remedial measures desirable and for estimating their effect when introduced Dr G M B Dobson, F R S Chairman of the Atmospheric Pollution Research Committee presented a report on the progress of the investigations carried out under his committee He dealt first with

the work in progress at the special survey of atmospheric pollution in and around Leicester Routine measurements had now been systematically made for a year over a considerable area to obtain information about the behaviour of pollution under various weather conditions It was proposed to continue these for a further year at least The work of the survey also included tests under practical conditions of new types of instrument and research on methods of measurement

SCOTLAND

Surgical Research Department at Edinburgh University

The Minister of Health Dr Walter Elliot, opened the extensions to the surgical research department of Edinburgh University on July 20 They consist of an extra floor for laboratories and research rooms The operating theatres which were a leading feature in the original building have been refitted and compare favourably with those of any modern hospital There is also a medical art studio staffed by two fully trained medical artists When this department was opened in 1926 it was the first *of its kind in the Empire but similar departments have* since been introduced elsewhere Dr Elliot at the opening ceremony said that the function of the department was threefold (1) the use of the experimental method in medical research (2) the intimate study of the anatomy and the pathology of the spread of disease (3) the gathering together of the younger members of the school for discussion of experimental physiological pathological, and clinical problems The importance of correlating all the most recent advances in physiology with practical problems in surgery could not be overemphasized That the younger generation of surgeons should be trained in the controlled observations of the laboratory was the best guarantee that a high standard of observation and record would prevail in our hospitals Referring to the experimental work of the department Dr Elliot mentioned the researches into the causes of gall bladder disease and of peptic ulceration of the stomach and duodenum and into the cause of death in various forms of intestinal obstruction The mechanism of massive collapse of the lung following operation had been studied as also had the relation of kidney disease to rise in blood pressure The successive changes which resulted when the outflow from one kidney was obstructed had formed the subject of a prolonged and delicate group of experiments A series of experimental observations had been made on the relationship of disturbed nerve function to disorders of the abdominal viscera With regard to the spread of cancer in man a special feature of the department had been the use of microscopical sections of whole organs combined with a detailed study of the spread by the lymphatic route Thus cancer of the stomach of the colon, and of the rectum had been the subjects of elaborate investigations and authoritative data had been obtained The feature common to all the research work Dr Elliot continued, had been the co ordination between clinical problems in the hospital and experimental investigation in the laboratory It was this stimulus of human interest and human need which lent to the work of a surgical research department the living interest which was often lacking in purely academic investigations

The tenth French Paediatric Congress will be held at the Hopital des Enfants Malades Paris from October 6 to 8 when the following subjects will be discussed Severe anaemias in infancy introduced by Dr Louise Weill of Lyons toxi infections in infancy introduced by Dr R A Marquézy and Mlle Ladet and megacolon and dolichocolon introduced by Drs Rohmer and Boppe Further information can be obtained from Dr Maurice Lamy, 94 Rue de Varenne Paris, 7e

Correspondence

Testimonial to Dr Robert Hutchison

SIR —The election of Dr Robert Hutchison to the Presidency of the Royal College of Physicians has given the greatest pleasure to a very wide circle of friends to whom Robert Hutchison has stood for all that is sound in the practice of medicine and all that is good in tradition We feel that this occasion provides the opportunity of showing our esteem to him personally and acknowledging in some degree his fine contribution to medicine

It is proposed to commemorate the occasion by presenting Dr Hutchison with his portrait and with this purpose in view we venture to make known the project to old students friends and societies in London Edinburgh and the Provinces

Personal donations should not exceed three guineas Cheques should be sent to the Manager National Provincial Bank 10 Marylebone High Street London W1 for the credit of the Robert Hutchison Testimonial Fund —We are etc

Cancer and Heredity

SIR —The question whether malignant cells differ from normal cells in their genetic constitution is one of the central problems of cancer If the existence of such a difference could be demonstrated conclusively it might justifiably be claimed that an explanation of that phase of the causation of cancer which in a recent lecture I called the growth of cancer had been found The statement made recently (*Journal* July 9 p 93) by Dr P A Gorer in which he refers to certain observations as presenting evidence for the existence of such a difference deserves therefore the most careful consideration The observations referred to by Dr Gorer are first that a virus induced tumour in the rabbit will regress spontaneously and secondly that the members of a pure line can be immunized against leukaemic cells derived from other members of the line

The virus induced tumour of the rabbit referred to by Dr Gorer is the infective papilloma discovered by Shope The argument underlying this conclusion is if I understand Dr Gorer correctly that the production of cytotoxins which he assumes to be responsible for the regressions of tumours demonstrates necessarily the existence of a genetic difference between the normal cells of an organism and the tumour cells which have arisen from them It is presumably true that cytotoxins can be produced in the organism by cells having a different genetic constitution but it does not seem to me to follow logically that we can invert this argument and accept the appearance of cytotoxins as conclusive evidence of the existence of such a genetic difference Furthermore, neither the infective papilloma nor leukaemia is a representative example of the phenomenon of malignancy In fact, the frequency with which the rabbit papilloma regresses spontaneously after an initial cellular prolifera-

tion distinguishes the behaviour of this tumour sharply from the behaviour of a spontaneous malignant growth The property which characterizes a malignant growth is its autonomous continued growth Regression of a spontaneous malignant growth is a phenomenon so exceptional and so incalculable that it may be given as the modern example of a miracle The initial epithelial proliferation of the Shope papilloma and its subsequent regression is a phenomenon exhibited also by a number of other virus diseases Thirty-five years ago Borrel by a close comparative study of such virus diseases which he called *épithélioses infectieuses* and of the epitheliomata arrived at the conclusion that *il y a analogies il n y a pas identité*

If we are to accept the spontaneous regression of the rabbit papilloma of Shope as evidence for the existence of a genetic change in the cells of this virus-induced epithelial proliferation, there seems to me no reason why such an argument should not apply also to the regression occurring in epithelial proliferations produced by other viruses We should then arrive at the conclusion that the entrance into epithelial cells of a number of different viruses leads to a change in the genetic constitution of these epithelial cells The regression of the virus-induced rabbit papilloma does not, therefore, present very convincing evidence for the existence of genetic differences between normal cells and the cells of this papilloma, or of malignant cells generally But even if, for the sake of the argument, we accept the line of reasoning adopted by Dr Gorer, there remains still the outstanding fact that the overwhelming majority of malignant tumours arising spontaneously in an organism as distinct from those induced by viruses never show any regression If the occurrence of regression is to be interpreted as evidence for the existence of genetic differences between normal and malignant cells does the absence of regression not present evidence for the absence of such genetic differences?—I am etc

Imperial Cancer Research Fund, Mill Hill N W 7 W CRAMER

The Origin of Cancer

SIR,—As an evolutionist let me assure Dr J V Fiddian (*Journal* July 9 p 92) that no one was more disappointed than myself on learning—after making careful inquiry at the fountain head—that the hypothesis of the conjugation of the cells of a malignant neoplasm had been abandoned for if true, it would have lent strong support to the view of the genesis of cancer in terms of reversion But it is worse than useless hugging a fancy in the face of plain plump fact Dr Fiddian will probably not persist in cherishing an illusion after reading the following statement by Dr Bashford in the Annual Report of the Imperial Cancer Research Fund for the year 1905 to 1906 than which nothing could better show the true scientific spirit with which that investigator was imbued

During the past year a paper has been communicated to the Royal Society (*Proc Roy Soc* 1906 Series B **77**) showing that the nuclear figures in cancer cells believed to indicate the occurrence of a true reducing division are in reality of the ordinary type In that paper we withdrew categorically any support which our observations might be conceived to furnish to this hypothesis or to the inference others have based upon it that essential similarities existed between cancer and reproductive tissue The attempt to explain the continued power of growth and the fluctuations in cancerous proliferation on the assumption of a reducing division followed by a nuclear fusion has been abandoned'

—I am etc

Esham Surrey July 13 CHARLES M BEADNELL Surgeon Rear Admiral

When to Start Sulphonamide Treatment in Gonorrhoea

SIR,—I was much interested in the letter from Colonel L W Harrison in the *Journal* of July 9 (p 90) His advice that sulphonamide remedies should not be given in the early acute stages of gonorrhoea has also been borne out in the treatment of children Since August, 1937, at the Children's Medical Home, Waddon, and at the South London Hospital for Women, twenty eight children, aged from 3 to 13 years, have had courses of prontosil album The response was most satisfactory clinically and bacteriologically in all except five cases It is significant that in four of these unsatisfactory cases treatment was started within two to seven days of the onset of infection They showed a slight clinical improvement, but this was not maintained, and tests remained positive for gonococci

The twenty-three cases which reacted well to treatment had infections varying in duration from three days up to three and a half years before their admission to the home They have now been watched for periods of from eight to thirty-five weeks since the completion of treatment Thirteen have passed full tests of cure—that is, a minimum period of six months' observation and at least twelve negative tests, including the final set after a provocative vaccine Six cases have had courses of uleron Three, with durations of infection of two, four, and nine weeks respectively, have now been watched since the completion of treatment for twenty-seven, twenty-four, and twenty weeks respectively without relapse The remaining three cases did not respond to prontosil album and they showed no improvement under subsequent treatment with uleron It is noteworthy that in the treatment of gonococcal vulvo-vaginitis in no case where the initial response to sulphanilamide treatment was good has there been as yet a relapse while the child remained in the home Follow-up reports from the venereal disease clinics, however, show that two of the chronic cases had "suspicious smears" and received further courses of sulphanilamide after leaving the home

In recent weeks, working in conjunction with the venereal diseases department of Guy's Hospital, fourteen children have had courses of T 693 The immediate clinical and bacteriological response has been excellent in every case, but no child has yet been watched for a longer period than two months since the completion of treatment The duration of infection before starting treatment in five cases has been from two up to twenty five days, and in the remaining nine cases from five weeks up to eight months It is too early at present to speak with any degree of certainty but there is a possibility that this new drug will prove more efficacious in the treatment of early acute cases than have other drugs of the sulphonamide series—I am, etc,

London W 1, July 12 D KATHLEEN BROWN

Anti-venereal Measures

SIR—I am obliged to Miss Alison Neilans (*Journal*, July 9, p 94) for correcting the inaccuracy in my reference to the decline of syphilis in Denmark, and even more so for admitting that Denmark and Sweden in this respect have "certainly achieved better results than England and Wales I regret however, that she seems to be as hostile to compulsion as in the controversy over the Edinburgh Bill of 1928, when it was argued that wherever compulsion had been tried it had proved a failure, that it

was bound to result in concealment of disease in resort to treatment by unqualified persons blackmail and police persecution of prostitutes If the interpretation of statistics is a debitable matter there is no ambiguity about the statements in the Scandinavian Report regarding these other subjects Colonel Harrison and his colleagues (p 120) could find no evidence that the operation of the law has led to concealment of disease to any appreciable extent or imposed undue hardship on the people As regards blackmail (p 116) they made careful inquiries in Denmark and Sweden, both of the public health and the police authorities whether any trouble has been experienced in this respect In both countries we were informed that there had been some instances in the past especially in the years immediately following the coming into force of the *lex veneris* in each country but that nowadays anything of this sort is very rarely found

With the old arguments against compulsion thus demolished by testimony that Miss Neilans accepts I would rest content but for a most misleading phrase in the last paragraph of her letter The choice before us she writes is to go on continuously improving our national fight against V D on voluntary methods or of abandoning our present system and going all out for compulsion The choice is nothing of the sort' No sane critic of our present methods of dealing with venereal diseases suggests abandoning them It was wise policy to provide facilities for treatment and educative propaganda in the years immediately following the war, before making treatment compulsory in this country But in the opinion of many of us it is more than time that these measures were supplemented by the granting to public health authorities of powers to trace sources of infection and to secure necessary treatment if need be by compulsion The Trevethin Committee in 1925 recommended the trial of compulsory measures in a limited area in this country In the light of the Commissioners report —their evidence *not* their conclusions—no fair minded person has good grounds for opposing such an experiment

In conclusion let me remind Miss Neilans whose work is directed so untiringly to the welfare of women that under the present voluntary system it is the women and children who suffer most The infant death rate from syphilis is all but three times as great in England as it is in Sweden (p 119) In that country too there were many who were afraid that compulsion would do more harm than good Thus runs the report (p 114) In Sweden it appears that there was acute divergence of opinion in the early years of the present century on the most suitable methods for dealing with venereal diseases and the associated problem of prostitution Notwithstanding the divergent views held on the matter of compulsory treatment prior to 1918 we did not find in any quarter the opinion that the law of 1918 was a mistake and there appears to be general agreement that the ill results which some authorities anticipated would follow the introduction of a system of compulsory treatment have in fact not occurred —I am, etc

Brentwood July 9 ROBERT FORGAN

Chicken-pox followed by Panophthalmitis

SIR —The reports of unusual cases of chicken pox in recent issues of the *Journal* prompt me to record the following case of chicken pox which was followed by panophthalmitis The clinical history has been supplied by Dr M D Mellersh house physician to the Chelmsford Hospital

A male child aged 2 years and 10 months was admitted to Chelmsford Hospital on February 16 1938 with fever and a petechial rash He had had scarlet fever at the age of 12 months On the morning of February 15 the child had complained of aching pains in the limbs and of sore throat In the afternoon a rash appeared and during that evening he had a convulsion lasting three quarters of an hour On February 16 he was delirious and vomited he was admitted to hospital On admission the child had a petechial rash mainly distributed on the legs thighs and forearms and a temperature of 102 F The throat was inflamed The pupils were equal in size and dilated but reacted normally No rigidity of the neck was present Kernig's sign was negative On February 17 the temperature was 101 F and the petechial rash was fading The left eye showed conjunctival oedema

I was asked to see the child on February 18 and found a panophthalmitis of the left eye with pus in the anterior and vitreous chambers There was no evidence of meningeal infection The corneal epithelium was intact and showed no staining on the application of fluorescein On February 19 the child developed a typical chicken pox rash at about the same time other children of the same family developed chicken pox at home This fact was communicated to me by the doctor who sent the first child to hospital the chicken pox in his case pursued a mild course The eye gradually deteriorated and its tension became subnormal its contents were eviscerated Dr F E Camps pathologist to the Chelmsford Hospital reported that cultures from the pus in the vitreous chamber grew colonies of *Staphylococcus aureus*

I have been unable to find any record of a case of panophthalmitis in chicken pox but cases have been recorded in typhus typhoid fever variola scarlet fever anthrax influenza and diphtheria —I am etc,

Chelmsford July 9 S G CORNER M.D

"Psychosomatic Illness"

SIR —All who, within recent years, have studied the writings of Dr James L Halliday upon what one might call the psychic side of everyday illness must have been deeply impressed and influenced and the further reading investigation and observation to which these studies led have profoundly influenced our practice I am indeed grateful for a widening of my outlook and I am confident that my patients to no small degree have benefited by my learning even a little of what I was taught nothing in my student days over thirty years ago I was, however while interested somewhat shocked upon my perusal of his paper in the *Journal* of July 2 and the reason was that he should do injury to a good case by calling upon the aid of Dr P L McKinlay the medical statistician to the Department of Health for Scotland I have great admiration and respect for the gifts of Dr McKinlay, and not a little fear

When we consider the anxiety state created in so many of our young men at the most vital time of their lives by unemployment the strain upon multitudes of our young women by employments for which either mentally or physically they were not created the excessive cocktail drinking of so many females in the seventeens to twenty-fives the excessive smoking amongst both young men and young women and the strain generally incurred as a result of the work sport and the actual living of modern life we cannot but believe in the profound influence of a psychoneurosis and a disturbance of the psycho neuro endocrine system in the promotion of modern invalidism and the burdens—physical mental and financial—which this invalidism is inflicting upon all classes involved We must not however allow the realization of these facts the influence of papers by men in the mental and official groove of Dr Halliday and the

statistics of Dr McKinlay to overweigh our sense of the physical "Mechanistic treatment' and investigation are necessary in the majority of the cases of the disorders of which Dr Halliday writes

I have had within the last few months a case of carcinoma of the stomach at the age of 19 years two cases at the age of 22 years, and one case at the age of 27 years It would have been worth the risk of "fixing symptoms to have saved these lives by a mechanistic investigation and treatment, the failure to carry out which on account of the early vagueness of the symptoms, cost the lives concerned Rheumatoid arthritis in the young and osteo arthritis in the middle-aged mean absolute ruin for these lives unless we invoke every means of investigation and treatment It is folly to call these diseases "psychosomatic"—at least no proof has been given—and, whatever the risk of "fixing symptoms" may be, to avoid any means of investigation or treatment known would be unpardonable Then there is heart disease in the young We general practitioners spend many moons pulling these cases over their rheumatic fever with its complications—peri-, myo-, and endocardial Our patient appears before the regional medical officer just when we allow him or her to move gently about, and the heart is apparently, but not in reality, sound "Ah! ' says the regional officer, "a case of defect of the psycho-neuro endocrine system" Up go the statistics, back to duty goes the patient, and a life is ruined because an official mind clouded by a theory ignored practical experience and common sense

I accept and admire much of Dr Halliday's work, he has opened up a comparatively new and most helpful line of thought for us all but do not let him go too far Above all, in such an indefinite sphere as the psychic, let him avoid the statistician or his whole work will tumble down like a pack of cards—I am etc,

Tain Ross-shire, July 7 E K MACKENZIE

The Unconscious Mind and Medical Practice

SIR—In your issue of July 9 (p 93) the late Dr Harry Campbell complained that psycho analysts give no precise definition of the term 'unconscious This definition has been given so many hundreds, or thousands of times, and has never varied since psycho analysis began fifty years ago that I had not thought it necessary to include it once more in my article It is simply 'that part of the mind of which the subject is not conscious —I am, etc,

London W 1 July 12 ERNEST JONES

SIR,—One can quite understand your correspondent, the late Dr Harry Campbell being puzzled at a first introduction to the concept unconscious fantasy' To the practising analyst all psychogenic symptoms, dreams, and much behaviour are merely outward and visible signs of fantasies which are still unconscious If for instance, a patient has a phobia of entering a tunnel it means that he is the victim of a fantasy that dreadful things will happen to him in that tunnel In that he does not know what these things are, or, indeed why he is afraid the fantasy is an unconscious one Similarly if a patient asks if the door is properly closed it usually means that he has the fantasy of somebody listening and overhearing his secrets though here the fantasy may not be entirely unconscious It is the business of analysis to bring these fantasies into the patient's consciousness in order to free him from their domination over his feelings and conduct and as an essential step towards cure—I am etc

London W 1 July 15 CHARLES BERG M D D P M

Abortion and the Law

SIR—Much publicity is being given in the lay Press to an alleged breach by a distinguished medical man of the law relating to abortion The question has therefore been raised of how far this law is open to criticism on medical, social, and genetic grounds We are aware that the subject is now being fully considered by a Departmental Committee, but we understand that the findings of this committee will not be made public in the immediate future Many arguments have been advanced in favour of widening the grounds upon which it should be legally permissible for pregnancies to be terminated It is to one only of these arguments—namely, the genetic—to which we would like to draw attention Certain recommendations have been made by a Departmental Committee on Sterilization as to the categories of persons for whom facilities for voluntary sterilization should be made available on genetic grounds We associate ourselves with these recommendations

From the biological standpoint we consider a sterilizing operation to be a more significant and drastic procedure than a termination of pregnancy, in that the first measure destroys fecundity, while the second does not We therefore think that facilities for the voluntary termination of pregnancy should be made available to those persons specified by the above-mentioned Departmental Committee on Sterilization as being appropriate candidates for voluntary sterilization We further think that similar facilities should be extended to women who have become pregnant as the result of an incestuous union or of rape That a child who has been brutally conceived as a result of a criminal assault on its mother will be handicapped later in life by environmental and nurtural factors can scarcely be disputed It is no less obvious that the child is liable to inherit from the father some at least of the qualities which prompted the action which gave it life These are not qualities which anyone would wish to be perpetuated

The force of these considerations has been recognized by at least one foreign country In Denmark there took effect on April 1 of this year a law according to which a pregnant woman may have a pregnancy terminated in the following cases

1 If the termination of pregnancy is necessary in order to avert serious danger to the life and health of the woman

2 If the woman has become pregnant as a result of an incestuous union or of rape

3 If there is obvious danger that the child owing to hereditary disposition will suffer from insanity mental deficiency from grave mental disorder epilepsy, or serious incurable physical disease

(A translation of this law appears in the *Eugenics Review* volume xxx No 1 (April 1938) p 43)

The grim predicament of the mother, the future well being of the child thus inauspiciously launched into existence and the interests of posterity simultaneously call for a widening of the grounds upon which abortion should be permitted—We are, etc,

Medico-Legal

CHARGE OF PROCURING ABORTION

Mr Bourne Acquitted

On July 18 and 19 Mr Aleck William Bourne FRCS was tried at the Old Bailey for unlawfully using an instrument with intent to procure the miscarriage of a woman (The police court proceedings were reported in the *Journal* of July 9 p 97) The indictment as first drawn did not contain the word unlawfully This appears in the Offences against the Person Act 1861 sect 58 on which the charge was based and the word was added to the indictment on the motion of Mr Roland Oliver KC leading counsel for the defence who maintained that nearly the whole of his case rested on the interpretation of the word Mr Bourne pleaded Not Guilty

Mr Oliver also asked that any member of the jury who might consider on religious grounds that there were no circumstances in which a pregnancy ought to be terminated should withdraw The Attorney General Sir Donald Somervell KC associated himself with the request and Mr Justice Macnaghten warned the jury that if any of them by reason of any preconceived view felt in a difficulty about giving a verdict according to law and evidence it was desirable in the interests of justice that he or she should retire from the trial None of the jury, however left the box Two members were women

Case for the Crown

The Attorney-General who appeared with Mr L A Byrne and Mr Henry Elam in opening the case read the words of sect 58 of the Act

Whosoever with intent to procure the miscarriage of any woman whether she be or not with child shall unlawfully use any instrument or other means whatsoever with the like intent shall be guilty of felony

He explained that the girl had been criminally assaulted and raped and a man had been convicted of the offence At that time she had been under 15 and a virgin On May 21 she was taken to see Dr Joan Malleson who came to the conclusion that the girl was pregnant and wrote to Mr Bourne a letter which after introduction, stated

Dear Mr Bourne

"I have been consulted by the organizer of the Schools Care Committee about a girl of 14 called —— It is possible that you saw in the paper some three weeks ago that this girl was assaulted in Whitehall by some soldiers The actual facts were that she was with two girl friends who ran off and left her and she was held down by five men and twice assaulted It appears that she is free of venereal infection but the Z.A test has just come back positive

I gather from the lady who brought her that everybody connected with the case *i e* the police surgeon the doctor at her work the school doctor etc all feel that curettage should be allowed her and I understand that Dr —— and possibly some other psychiatrists of good standing would be prepared to sponsor therapeutic abortion I presume they must mean on grounds of prophylaxis because there does not appear to be any nervous disorder present All this of course gets us nowhere unless someone of your standing were prepared to risk a *cause celebre* and undertake the operation in hospital

Many people hold the view that the best way of correcting the present abortion laws is to let the medical profession gradually extend the grounds for therapeutic abortion in suitable cases until the laws become obsolete so far as practice goes I should imagine that public opinion would be immensely in favour of termination of pregnancy in a case of this sort

If there is any chance that given adequate professional backing you feel prepared to consider this I would take a lot of trouble to get people of high standing to see this girl and should of course feel that it was most valuable if the case was conducted publicly in hospital

I am told that a rather grim twist is added to this case by the fact that the girl's parents are so respectable that they do not know the address of any abortionist and are I gather having to set about to find one for they could not possibly let her go through with this She seems a normal healthy girl and on medical terms there is obviously nothing to be said

I hope you will forgive me for troubling you about this

With kind regards

Yours sincerely

JOAN MALLESON

PS—Unfortunately the matter is made a little more difficult by the fact that the girl was admitted to St Thomas's Hospital under Mr —— who I think from the report of his attitude must be Catholic He took the conventional standpoint that he would not interfere with life because the child may be the future Prime Minister of England and that anyhow girls always lead men on But she is not any longer under his care nor is it yet public that the Z.A test is positive

On May 27 Mr Bourne had replied

I am interested in the case of rape which you describe in your letter I shall be delighted to admit her to St Mary's and curette her I have done this before and have not the slightest hesitation in doing it again Therefore please let me have the girl's name and address and ask her parents to send her to see me I have said that the next time I have such an opportunity I would write to the Attorney General and invite him to take action

On May 31 the girl's mother had taken her to see Mr Bourne and on the same day the father had written to him saying that he gave his consent to the operation to be done for his daughter in St Mary's Hospital as arranged with his wife on condition that no publicity of any sort was given to the case On June 2 Mr Bourne wrote to Dr Malleson telling her of this request to keep the operation entirely secret and said that he must respect their wish and that the operation would be done next week To the father he wrote assuring him that no effort would be spared to keep the matter secret Sir Donald added that the matter had been brought to the attention of the police authorities but he did not suggest that this had been in any way due to any act by the defendant or that he had done anything inconsistent with the undertaking given in his letter The operation had been performed on June 14

In conclusion the Attorney General said that the jury would have to decide subject to the judge's ruling and on the facts whether there had been an unlawful use of an instrument to procure a miscarriage He also admitted that on the construction of the statute if it were necessary in order to save the life of a mother to use an instrument to procure a miscarriage he would not submit that that would be an offence under the section

Evidence for the Prosecution

Giving evidence for the prosecution the girl said that on April 27 she had been raped by a soldier and that at that time she had been 14 years and 9 months old The defendant had performed an operation on her Her father gave evidence of the correspondence with Mr Bourne and said in answer to Mr Oliver that he had given no one permission to publish the case

Dr Joan Graeme Malleson said in cross-examination that there was very great variation of opinion among obstetricians and medical people generally about what was lawful in regard to the procuring of abortion Some went so far as to say that it was not permissible in any case even to save life and others took the view that it was lawful in the interests of the health of the mother She shared that view and held that it was better to perform an abortion than that a woman should be physically mentally, or nervously broken down by having a child particularly conceived in such circumstances She believed that was also Mr Bourne's view Many doctors

thought that miscarriage should be permissible upon what might be called 'humanitarian grounds alone, but not many used that term actually for procuring an abortion She did not know any who thought that was legal She knew some doctors, however, who would produce a miscarriage when the child was likely definitely to inherit a bad trait She had heard of doctors who had taken pity on a woman who had been raped, and she thought that right In answer to the judge, she said she meant pity for a woman where there had been a prosecution for a rape in a court of justice, and not where the woman complained that she had not consented to sexual intercourse She agreed that danger to a woman's life was increased by the fact that she was only 14 and also that she had been injured in the process of a rape, that her mental condition would be such that she might be in grievous danger and that her nervous system stood a good chance or might stand a good chance of being shattered She considered that a proper case

Mr P C F Wingate said he had been resident at St Mary's Hospital until the end of June Before the girl was admitted Mr Bourne had told him he had been asked to see the girl, that she was pregnant as a result of rape and under the age of consent, and that he had been asked to admit her in order to terminate pregnancy and also asked to report his action to the appropriate authorities in the hope of making a test case of it He had understood Mr Bourne to say that the parents were objecting to the publicity that must follow such a case, but the defendant had not said whether he would report his action to the authorities A test for pregnancy had been made and the result was positive He had been there when Mr Bourne operated on June 14

Cross examined by Mr Oliver, he said that it was proper that before performing such an operation the girl should be kept under observation for a considerable time, and that it was quite proper for Mr Bourne to do so for eight days It was careful and proper treatment to repeat the tests for pregnancy and venereal disease which had been done before her admission, to verify both results If she had had venereal disease the operation would not have been performed because of the fear of infection He had been present when Mr Bourne had taken the swab for the venereal test This would not hurt her it would be uncomfortable She had been a little distressed and cried He had not heard Mr Bourne say anything that he could remember Her behaviour had not particularly impressed him, he had rather expected her to be distressed as the circumstances were very unpleasant for her He agreed that the girl was a proper subject for curettage

Chief Inspector Walter Bridger, examined by Mr Byrne said that he had called on Mr Bourne on June 14 The defendant asked whether it was about the girl and hearing that it was, he said I emptied the uterus this morning, I want you to arrest me' The witness cautioned him and said the facts would be reported to the proper authorities The defendant said that the girl had been brought by her mother to his house, admitted to St Mary's Hospital and placed in his ward under his care and since she had been in she had been waiting for a pregnancy test, which was positive and tests for gonorrhoea which so far had been negative As an obstetric surgeon in his opinion it might be dangerous for a girl of her age to bear a full-grown child

Cross examined, witness said he wrote down Mr Bourne's statement in his book as the defendant dictated it He had wished to warn Mr Bourne that in no circumstances could an operation be consented to but as it had already taken place his visit was useless

Mr Oliver Was he rather nettled at that and did he say that he had his duty as a surgeon and his responsibility and could not be dictated to by you on a matter of that sort'—No but I will accept it if he says it

I rather that you will accept anything he says'—I would, Sir

This closed the prosecution's case

Counsel's Submission on the Law

Mr Roland Oliver said that as much of the case would turn on the form of the learned judge's direction to the jury and the law of the case was what his Lordship declared it to be, he invited the judge to direct the jury on the law at that stage He could not he said address the jury and put forward a view of the law unless he knew what the judge held that law to be he must not put before the jury a different view of the law from that of the judge The case was not covered by any authority at all It turned on what the judge decided was the meaning of the word "unlawfully' whether it meant, as the Attorney General said, that nothing was lawful except for the purpose of saving the life of the mother—he did not know where his learned friend had got that definition from!—or whether as he himself contended anything was sufficient justification for an abortion which, in the view of a responsible and skilled surgeon, was for the benefit of the mother's health in the sense that her health would probably be seriously impaired if it was not done Anything he continued, which would induce a competent surgeon to remove a limb or an eye for the sake of the patient's health should be sufficient justification for abortion, the same standards should apply It was fantastic to suggest that a major operation was only justified for the purpose of saving life In other sections of the Act the words "unlawfully and maliciously occurred it was a felony punishable like abortion with penal servitude for life to give an anaesthetic or to cause grievous bodily harm 'unlawfully or maliciously It could not be said that an anaesthetic could only be used in a case of life and death Surgeons who took off arms and legs would be committing the criminal offence of mayhem or maim if they were not justified by the benefit to the patient's health The test should be the same through all sections of the Act He submitted that a doctor was entitled to induce a miscarriage where, if he did not there was a danger to the girl's health—using that word in the broadest sense The jury should be asked "When Dr Bourne used the instrument on June 14, was he acting in the honest and reasonable belief, based on adequate knowledge and experience that it was in the best interests of the girl's health that her pregnancy should be terminated?' Russell on *Crimes* said that the word "unlawfully' excluded from the section acts done in the course of proper treatment in the interest of the life or health of the mother That statement had stood unchallenged since 1909

The Judge's Direction

Mr Justice Macnaghten addressing the jury, said

This section contains the word "unlawfully Counsel are agreed, and it is my opinion that the word 'unlawfully is not a meaningless word in this section, and it necessarily follows that there may be a procurement of abortion which is lawful The procuring of abortion was an offence long before 1861 It was an offence by the Common Law of England before ever Parliament existed It was only in the reign of George III that it was made a statutory offence Apparently there was some question under the Common Law whether the procuring of abortion by the administration of poison was an offence and an Act was then passed making it clear that it was an offence This section was merely a re enactment of the previous statutory provisions

The section begins by making it unlawful for a woman to procure her own miscarriage That undoubtedly has been the law of England from the earliest times A woman is not entitled to procure her own miscarriage and the fact that she desires urgently to be relieved of her trouble does not justify the procurement of an abortion It is true that there is no authority on this matter so far as I am aware The issue that you will have to try is an issue that has never before been raised but it is obvious that where the act is done—anyhow in modern times—by a skilled person, without any risk to the

patient for purpose of saving her life it must be lawful We have not had any medical testimony so far—it may be that we are going to have some—but laymen know that there are cases where it is reasonably impossible for a woman to be delivered of her child and survive In such cases an operation for terminating pregnancy plainly becomes lawful I have no doubt that has always been the view of the judges of this country and of the great men who sat in Westminster Hall on the King's Bench

To-day the position is greatly simplified by an Act of Parliament passed in the year 1929 If after a child has been delivered and has an existence independent of its mother the mother or the accoucheur kills the unwanted baby that is murder and always has been murder by the law of England There arose a case in which it was thought that provision had to be made where an accoucheur while a woman was being delivered of a full term child—because the child was not wanted—killed it before it had an existence independent of its mother and yet in circumstances that did not amount to the procurement of abortion because the child was being delivered at full time in the ordinary course of nature Parliament thought right to provide for that case *Of course it is a case that would very rarely arise and even much more rarely ever be known of* A Bill was passed through the House of Lords in the year 1928 and sent down to the House of Commons bearing what might be thought the somewhat misleading title of the "Infant Destruction Bill"—a title which might give rise to the idea that it was a Bill for the *destruction of infants The House of Commons never gave* it a second reading under that title and in the following year it was introduced again and passed into law with the more illuminating title of the Infant Life Preservation Act 1929 It is of tremendous value in throwing light on the law of this subject Section 1 enacts

> Any person who with intent to destroy the life of a child capable of being born alive by any wilful act causes a child to die before it has an existence independent of its mother shall be guilty of felony to wit of child destruction and shall be liable on conviction thereof on indictment to penal servitude for life provided

And here are the words which require your close attention

> That no person shall be found guilty of an offence under this section unless it is proved that the act which caused the death of the child was not done in good faith for the purpose only of preserving the life of the mother

You will observe that by that proviso it is not for the accused to prove that it was done in good faith for the purpose of preserving the life of the mother it is for the Crown to prove that it was not done in good faith for that purpose *The burden of proof rests upon the Crown*

The direction which I propose to give you is this If you are satisfied by the evidence when we have heard it all that Mr Bourne did not terminate the pregnancy of this girl in good faith for the purpose of preserving the life of the girl if you are satisfied that the Crown have proved that negative you should find him Guilty If you think that the Crown have not proved the negative that the law requires them to prove then you should find him Not Guilty

What is the meaning of preserving the life of the mother? That is a matter which must depend on the circumstances of the case and on the evidence produced before you It must be obvious that it may be perfectly lawful to perform the operation if the doctor is of opinion that the continuance of the pregnancy is certainly going to result in the death of the mother Of course it may be—we may hear, we do not know—that if the operation has to be done the sooner it is done the better There are many considerations which influence the decision of the doctor on what should be done in the particular case If the Crown fail to satisfy the jury that it was not done for the purpose of preserving the life of the mother then my direction to you here is that your verdict should be a verdict of Not Guilty If on the other hand the Crown do satisfy you that they have discharged the burden placed upon them under the section then your verdict should be Guilty I give you that direction in law because of my view that the proviso to Section 1 of the Act of 1929 explicitly states what always has been implicitly in the section under which Mr Bourne is charged here

Mr Roland Oliver I cannot altogether separate the questions of what is necessary to preserve life and what is necessary to preserve health

Mr Justice Macnaghten I quite agree with you and it is for the jury on the facts to say if they think that the Crown have discharged the burden put upon them. It is a question of fact in each particular case and nobody can say without knowing the facts of the case whether the abortion was lawful or unlawful

Case for the Defence

Mr Roland Oliver then addressed the jury He said that probably never before had a man stood in the dock in that court because he had acted from a motive of purest charity and could say that he had believed that he was carrying out his duty under the law which was to look after his patient to the best of his ability to guard her health and protect her from mental or nervous breakdown Mr Bourne was at the head of his profession and altogether above the suggestion that he wanted advertisement There was probably no one in court who would not at least give him praise for his courage he had done that which he believed to be right

For various reasons women would always demand abortion merely because they did not wish to bear children and professional abortionists would always be forthcoming Those of course were persons against whom Section 58 was directed There was no wonder that the gravest misgivings had always been and horrified *medical men in dealing with the question of what cases* were legitimate and proper for this operation Their views ranged from persons who thought that it should never be performed at all to those who would do it merely because an unfortunate child had been raped As the law stood this was not a legitimate ground Between those two extremes came the views of a great body of *medical men and women* who said that the operation could not be limited to cases in which the mother's life was in immediate danger but that a reasonable view must be taken The operation must be done they said by a person of skill knowledge and experience and he must balance the ordinary risk of the operation against the danger to health in its widest sense if the operation were not performed

Mr Bourne had spent his life in that controversy, and had experience of cases in which the operation ought in his view to have been performed and had not been with disastrous results He had been prepared to make a *martyr of himself* for the purpose of having the law declared his view being that if the general interests of the patient's health were endangered by having a child it was the surgeon's duty to operate He had not courted publicity but had been willing when the proper case came along to have the matter dealt with That this had happened in the particular case had been none of his doing The wisdom of his attitude did not concern the Court It was a thoroughly gallant thing to do, and no one would *suggest that his motives had been anything* but the highest from beginning to end The whole thing was a work of the purest charity

Mr Bourne in the Witness-box

Mr Aleck Bourne then went into the box and was examined by Mr Roland Oliver

He said that he had devoted *much attention to the question* of when the termination of pregnancy was justified To him in common with all gynaecologists it was a constant problem The views of his professional brethren varied enormously In October 1935, he had been about to terminate pregnancy in a child of 15 and his house-surgeon had declined to assist him and on Mr Bourne's invitation had walked out of the operation theatre That doctor had only recently been qualified and had objected on religious

grounds This refusal had led Mr Bourne to think very hard and he had determined to obtain the ruling of the Court on the next occasion—that was why they were there He felt very deeply about the matter If there were adequate medical reasons in the widest sense on his interpretation of the law based on the everyday practice of reputable members of the profession he considered it justifiable to terminate pregnancy and he could not draw a line between danger to life and danger to health If a doctor waited for danger to life the woman was past assistance He regarded abortion as a major operation, speaking in terms of other branches of surgery He thought that 99 per cent of his colleagues would be agreeable to have abortion performed on such patients as those on whom he had done it He most emphatically included the preservation of mental health and the health of the nervous system among his indications He did not think that such physical injuries as the girl had received would have caused a direct difficulty in her delivery The circumstances of her conception were, however, such as to implant in her mind seeds of terror Those who had clinical insight knew that terror and fear were the most serious deterrents to the unfolding of the whole process whereby assistance might be needed which would in its turn do damage The fact that she a virgin had been raped and treated in that way was a very strong element to him in making up his mind Her age was another, the chief bones in the pelvis were not united Her temperament and nervous make up would be an important factor He had naturally felt that some process of observation should be carried out but frankly admitted a bias in the direction of relieving the child when he heard that she was connected with the crime

Believing that the operation would be essentially necessary he had first had to exclude at least three factors He had felt practically certain from the first that she was no mental defective, he would not have operated if she had been because she would not have suffered mental distress in the pregnancy, and the quality of the child was no concern of his If she had belonged to the prostitute type he would probably though not certainly have decided against operating for similar reasons Thirdly, if she had been infected with venereal disease, an operation might have spread the infection up the birth canal and caused really serious illness On the contrary he had decided that she was emphatically suitable to have her uterus emptied The ward sister had reported with surprise that the girl had not appeared to be worried at all and was unusually cheerful considering the circumstances This had at once made him suspicious that her cheerfulness was a façade of courage erected as a defence against her feelings He had not made any kind of examination before taking the swab for the infection test and had been as careful as possible not to cause pain then He had watched her demeanour when it had been first brought home to her by this procedure that she was really pregnant and the memory of the assault had come back to her Instead of her bearing the trifling discomfort with fortitude she had broken down and cried That had confirmed his decision and later in the day he had operated after seeing the pathologist himself about the swab The mischief he had feared for her if the pregnancy had proceeded included as its least important factor the possibility of physical injury which could to some extent have been repaired He had however learnt from the many young children of this kind he had seen that much more important was the mental and nervous injury for it was extremely difficult to cure It would have been a source of nervous psychoneurotic and other troubles and there would perhaps have been secondary physical illnesses all her life

In answer to cross examination by the Attorney General Mr Bourne said that he had never intended to operate on the girl before observing her and carefully considering whether she was a suitable case He had admitted her with a bias in favour of operation because in his experience a large number of similar cases required it His record of abortion would stand any examination He was ordinarily much stricter than many of his colleagues but when there was a case with definite indications he would not hesitate in terminating pregnancy Statistical experience showed that young children were subject to a much higher proportion of physical disorders and serious dangers than adult women

The Attorney General 'I suggest to you that there is a perfectly clear line of distinction between danger to life and danger to health'—"No I cannot agree to that without qualifying I cannot say just Yes or No I can say that there is a large group whose health would be damaged but whose life almost certainly would not be sacrificed There is another group at the other end whose life would be definitely in very great danger and there is a large body of material between those two extremes in which it is not really possible to say how far life would be in danger, but we find of course, that health is depressed to such an extent that their life is shortened as in cardiac cases Therefore you can say that life is in danger because death might occur within measurable distance of the time of their labour'

The operation said Mr Bourne, had certainly not been necessary to preserve her immediate life, but to say that her nervous system would probably be adversely affected would be a very mild term He could not recall personally any instances of nervous or mental damage, but he had had many brought to his knowledge by reading and by conversation in the general way of collecting experience by contact with medical men Such a point could be appreciated by one even with rudimentary knowledge of the elements of psychological medicine Asked whether it was not usual for a gynaecologist in such a case to take a second opinion he answered that he was usually appealed to himself and had considered himself in this case as a second opinion

Further Evidence for the Defence

The defence then called Dr Jacob Arthur Gorsky, divisional police surgeon who described how he had examined the girl on the night of the rape and had found her very distressed though giving a rational and coherent story He said that his examination had revealed a physical condition consistent with the story of violence and rape which she had told to him then and subsequently at the trial of the guardsmen

Dr J R Rees testified to Mr Bourne's professional reputation and said that things of the mind were bound up with physical well being He was from time to time consulted professionally as to the advisability of terminating pregnancy, and had often considered carefully the grounds on which he would advise such treatment The terror likely to be produced in this case and the age of the child, would strongly predispose him towards advising it He did not think that Mr Bourne was putting it too high when he said that these two facts alone would give him a strong bias in favour of operation they would have just the same effect on his own mind In this case he would certainly have advised the termination of pregnancy There would have been no question about it because he was sure there would have been trouble in the future Asked what the danger was he replied that from his angle which was the mental one the results to be expected were rather comparable with shell shock This girl had been in fact wounded, one might say that she had been blown up and he did not see why she should go on and be buried by having to continue pregnancy She was almost certain to get some form of mental breakdown He knew personally of two cases where intercourse had taken place under the age of consent one was by rape and the other by incestuous relationship with the father Both the patients had carried a child to term, and had been grown up when he first saw them Both had suffered from varying neurotic difficulties which had crippled them neither had made a successful marriage, both were terrified at all matters connected with sex and were anxious and unstable in every way Had the pregnancies been terminated he thought that without question the mental state would have been better His colleagues had related to him a number of similar cases in some of which there had been definite mental breakdown—schizophrenia—as well as all sorts of abnormalities He could not find any case in which the mother had remained mentally normal though in two cases she had been physically normal

The Attorney General asked Dr Rees if it were not impossible to assign specific portions of the mental disturbance

to the original rape and the subsequent child bearing respectively Dr Rees replied that it was not entirely impossible A recent research on child assault had produced some evidence to show that the dramatic episode was not so important as the continued strain and the general emotional atmosphere For some years he had been collecting data about cases of rape in which conception had not occurred Symptoms certainly might appear in such cases but he definitely thought that the danger of mental disturbance was reduced if pregnancy was terminated when it occurred Preserving life to him meant preserving health it was not possible to let a person drift into a mental breakdown in the future and say one was preserving life The same symptoms might arise from other causes but he thought that the resentment the immense crushing sense of inferiority and the interference with instinctive life in the degree in which they were found in these cases constituted a syndrome which was in some sense unique

Mr William Gillatt declared that Mr Bourne in the view of those who knew him was a very competent obstetric surgeon well qualified to form an opinion on the desirability of operation After hearing Dr Rees's views he would himself undoubtedly have terminated pregnancy in this case He described to the Court the additional risks run by young girls in childbirth both from the toxaemias of pregnancy and from the incomplete ossification of the pelvis The maternal mortality of the 15–20 age group was one per thousand higher than the average He had collected from the reports of two maternity hospitals three cases of delivery between 13 and 14 four cases between 14 and 15 and 35 cases between 15 and 16 this girl would have been 15½ at the time of delivery The percentage of abnormality in labour in these children was 45–50 and the figure was borne out by a German paper on the same subject The principal difficulty which arose was ineffective action of the uterus and delay so that interference was necessary and sepsis was likely to result This did not pass off if infection occurred in childbirth it remained for life

Lord Horder examined by Mr Roland Oliver said he was not infrequently consulted in cases where severe mental or nervous breakdown seemed likely to occur if pregnancy were not terminated and that he considered the operation was justifiable in such cases The facts of the child's age and the rape would have led him to the same conclusion as Mr Bourne had come to so far as he could judge without seeing the patient It was not his opinion that the operation should *only be performed to save life from immediate danger*

Concluding Addresses by Counsel

Mr Oliver in his final address to the jury, said that Mr Bourne's attitude was that what he had done was lawful, right, and honest and he had committed no offence The statute of 1929 which dealt with the killing of a child at the point of birth, dealt with a case in which obviously immediate danger to life would excuse the destruction of the child Applying it to the present case one could speak properly of the preservation of the life of the mother in speaking of preservation of her health for her life ultimately depended on her health A wide and liberal view should be taken of the words to preserve the life of the mother The proposition that a doctor could only terminate pregnancy if the girl would otherwise die was a very extravagant one and to say that he must not operate even if he were faced with the practical certainty that she would have a complete nervous and mental breakdown revolted one's sense of justice and every other sense Mr Bourne was not responsible for the views of Dr Malleson The prosecution had called no medical evidence and there was no evidence to throw doubt on the honesty and competence of the defendant or upon the proposition that the mental health of the girl for the rest of her life was likely to be greatly prejudiced If you say he concluded, that the defendant had committed a felony one will be left *reflecting gloomily on the sense and reasonableness of one* branch of English law

The Attorney General in his concluding address for the Crown, said that the prime reason why abortion was a grave offence under the law and perhaps always had been was that the law was based on the sacredness of human life The destruction of an unborn child was the *destruction of a potential human life He suggested that* there was a fundamental difference between preserving life and preserving health In any given set of circumstances a doctor or surgeon would be able to say "I did this to preserve the life of my patient He would then mean something different from when he said I did this to preserve the health of my patient Mr Bourne's letters showed that he took a very wide view of the cases in which the operation was proper to be performed The evidence showed that the Crown had succeeded in proving that the operation had not been done for the purpose only of preserving life Sir Donald Somervell did not minimize he said the possible mental effects of which Mr Bourne and the other doctors spoke The question was whether those mental effects grave as they were justified the termination of the pregnancy

The Judge's Summing up

Mr Justice Macnaghten in summing up the case to the jury said that the offence was regarded by the law as a grave one The punishment might be penal servitude for life and the charge was only triable by a judge of the High Court As a rule a case would only come before the Courts when something had gone wrong because the crime was committed secretly but judging by the cases that came before the Courts the crime was by no means uncommon This was the second case at the present sessions in which a charge had been preferred for an offence against this section He only mentioned the other case to show how different the present case was from those of the usual type A woman without any medical skill or qualification had done what was alleged against Mr Bourne she had unlawfully used an instrument for the purpose of procuring the miscarriage of a pregnant girl She had done it for money £2 5s had been her fee She had come from a distance to a place in London to do it and a pound had been paid her on making the appointment She had used her instrument and within an interval of time measured not by minutes but by seconds the victim of her malpractice had been dead on the floor She had been paid the rest of *her fee and had gone away That was the class of case* which usually came before the courts

Mr Bourne's case was very different A man of the highest skill had openly at one of our great hospitals performed the operation—whether it was legal or illegal the jury would have to determine—as an act of charity without fee or reward unquestionably believing that he was doing the right thing and that he ought in the performance of his duty as a medical man devoted to the alleviation of human suffering to do it That was the case which the jury had to try

The matter had never, so far as he knew arisen before for a jury to determine in circumstances such as these Even among learned counsel there had obviously been some doubt as to the proper expression of the law Certainly one of the medical witnesses Dr Malleson, had shown uncertainty as to the law It appeared from her letter that her views about the law were erroneous and it was only fair to her to say that her last statement in the witness box had been that she was a doctor and not a lawyer On the previous day in response to a request by Mr Oliver, he had indicated to the jury his view of the law The jury would take the law from him if he erred and they found the accused guilty the Court of Criminal Appeal would put the matter right He saw no reason to modify his earlier directions The question the jury had to determine was, 'Has the Crown proved to your satisfaction, beyond reasonable doubt that the act which Mr Bourne admittedly did was not done in good faith for the purpose only of preserving the life of the girl?' If the Crown had failed to satisfy them of that Mr Bourne was entitled to a verdict of acquittal On the

other hand if they were satisfied beyond all real doubt that Mr Bourne had not done the operation in good faith for the purpose only of preserving the life of the girl the verdict should be "Guilty"

I fully agree, said his Lordship 'with the criticism of Mr Oliver that the Infant Life Preservation Act, 1929 is dealing with the case where the child is killed while it is being delivered from the body of the mother But the proviso in that Act—that no one is to be found Guilty unless it is proved that the act was not done in good faith for the purpose only of preserving the life of the mother—expressed what has in my view always been the law with regard to the procurement of abortion Although that proviso was not expressed in the Act of 1861 the use of the word unlawful' implies the same thing that no person ought to be convicted under section 58 of the Act of 1861 unless the jury are satisfied that the act was not done in good faith for the purpose only of preserving the life of the mother

This is a case of great importance to the public and more especially to the medical profession It has nothing to do with the ordinary cases of procuring abortion which I have had before me here Those cases concern persons with no skill and no medical qualifications with no pretence of being able to say that they were acting for the preservation of the mother's life Cases of that sort are in no way affected by consideration of the question that is put before you It has always been the law that the Crown have to prove the offence beyond reasonable doubt to prove that the act was not done in good faith for the purpose only of preserving the life of the mother In the ordinary case no question can arise it is obvious that that defence could not be available to the professional abortionist

We have had a great deal of discussion about the difference between danger to life and danger to health It may be that you are more fortunate than I am I confess I have a great difficulty in understanding what the discussion really meant Life depends on health and it may be that health is so gravely impaired that death results The Attorney General suggested to Mr Bourne that there was a clear line of distinction between danger to health and danger to life [his Lordship read the Attorney General's question] and he assumes that it is so But is it? Of course there are things that are obviously a danger to health without being a danger to life Rheumatism I suppose is not a danger to life but it is certainly a danger to health Cancer is plainly a danger to life according to experience as it exists to day maybe a time will come when cancer will not be a danger to life There are maladies that are a danger to life and maladies that are a danger to health but is there a clear dividing line a perfectly clear line of distinction? I should have thought not I should have thought that impairment of health might reach a stage where it was a danger to life [His Lordship read Mr Bourne's answer stating that there was a large body of patients between the two extremes of whom it was not possible to say how far life would be endangered but whose health was depressed to such an extent that life was shortened and death might occur within measurable distance of labour] The learned judge continued

If that is the view that commends itself to you that you cannot say that there is this division into two separate classes with a dividing line between them then it may be that you will agree with the view that Mr Oliver put forward when he invited you in construing those words for the purpose only of preserving the life of the mother,' to take a wide and liberal view of their meaning I myself prefer the word 'reasonable to the words wide and liberal I do not think it is contended that those words mean merely for the preservation of the life of the mother from instant death There are cases as I expect you know from your own experience, where it is reasonably certain that a woman will not be able to deliver the child of which she is pregnant In such a case where the doctor anticipates basing his opinion on the experience and knowledge of the profession that the child cannot be delivered without the death of the mother in those circumstances he is entitled—and indeed it is his duty—to perform this operation with a view to saving the life of the mother If knowledge and experience teach that that is going to be the result obviously the sooner the operation is performed the better It is not necessary that the doctor should wait until the unfortunate woman is in peril of immediate death, and then at the last moment if he is successful, snatch her from the jaws of death He is not only entitled but it is his duty to perform the operation with a view to saving her life

"You have heard of the wide variations of opinion which exist within the medical profession Some there may be who hold the view that the fact that the woman desires an operation to be performed is sufficient justification for it That is not the law On the other hand there are others who for what are said to be religious reasons, object to the operation being performed at all in any circumstances That is not the law On the contrary a person who holds such in opinion ought not to be a doctor—practising anyhow in that branch of medicine Indeed in a case where the life of a woman could be saved by performing the operation if a doctor refused to perform it on the ground of some religious opinion and the woman died, he would be in grave peril if he were brought before this court on a charge of manslaughter by negligence He would have no better defence than a person who again for some religious reason refuses to call in a doctor to attend to his child Where, if a doctor had been called in the life of the child would have been saved and a person for a religious reason—a so called religious reason—refuses to call in a doctor he is also answerable to the criminal law for the death of his child I mention those two extreme cases merely to show that the law which is a reasonable law lies between those two It does not permit of the termination of pregnancy except for the purpose of preserving the life of the mother But I think myself that those words ought to be construed in a reasonable sense if the doctor is of opinion on reasonable grounds on adequate knowledge, that the probable consequences of the continuance of pregnancy would indeed make the woman a physical wreck or a mental wreck, then he operates, in that honest belief 'for the purpose only of preserving the life of the mother

'These general considerations have to be applied to the particular facts of this case Everything that has been said here tends to confirm the view that each case must depend upon its particular facts and the circumstances of each case must vary infinitely It is very undesirable that a young girl should be delivered of a child Parliament has recently raised the age of marriage of a girl to 16, the opinion of Parliament is that it is very undesirable that a girl below 16 should marry and have a child The medical evidence here establishes that view that it is undesirable that a young girl should go through the stage of pregnancy and finally of labour Then regarding the effect of rape upon a child under the age of 16 Dr Rees has said that from his experience and his knowledge the mental effect produced by pregnancy brought about by rape has a most prejudicial effect upon the mind of the girl It is the merest common sense that if a girl is feeble minded or belongs to the class that is described as the prostitute type for her it is a different matter But for an ordinary decent girl brought up in an ordinary decent way, by parents without any knowledge—as Dr Malleson observed—of where they could look for a professional abortionist you may think that Dr Rees was not understating the probable effects on her life of having to bear this child

'All this of course, depends upon your opinion As far as danger to life is concerned of course you cannot be certain that there is danger to life unless you wait until a person is dead Nobody asserts that the operation only becomes legal when the patient is dead It is all a matter of opinion The example of acute appendicitis was mentioned It is a matter of common knowledge that the surgeon prefers to operate when the appendicitis is not active Take this case A child is suffering from symptoms which a doctor diagnoses as appendicitis The symptoms subside and the doctor says The symptoms have subsided and she will probably get quite well again, but at the same time it may be merely a temporary lull and to morrow the condition may be much worse If you let me prepare the patient and operate to day

I can guarantee the life of your child and the operation will be performed in perfect safety If as probably happens when there is appendicitis the child gets worse the appendicitis becomes acute and the doctor has to operate as he may have to in such circumstances that he cannot guarantee the life of the child the child may die Suppose that choice is put to the parents Will you have the operation to-day or will you wait until to-morrow to see whether the disease becomes acute? —what answer is there to that question but to say Do it now do it while you are still safe do not wait to see whether she is near death The operation may be performed and it may be found that the appendix was quite all right but is the surgeon blamed for performing the operation? He used his best judgment The surgeon can only base his opinion on knowledge and experience and if he in good faith thinks that it is necessary for preserving the life of the child in the real sense of the words not only is he entitled to perform the operation but it is his duty to perform it

In regard to any other operation on the human body obviously no difficulty arises The only difficulty that arises in the case of abortion is that the law of this land has always held human life to be sacred and the protection that the law gives to human life extends to the unborn child in the womb The unborn child must not be destroyed except for the purpose of preserving the yet more precious life of the mother

In conclusion the judge repeated the question on which the jury had to return their verdict He added that so far as the members of the medical profession themselves were concerned they alone were the persons who could properly perform such an operation It was to be hoped and expected that none of them would ever lend himself to the malpractices of the professional abortionist No doubt they would act only in consultation with some other member of the profession of high standing so as to confirm the view that the circumstances were such that an operation had to be performed and was legal

The jury were absent for forty minutes and returned a verdict of Not Guilty

Mr Aleck Bourne's defence was conducted by Messrs Le Brasseur and Oakley solicitors to the London and Counties Medical Protection Society

AN ACTION WITHDRAWN

At Leeds Assizes on July 12 an action brought by a patient against a hospital house-surgeon was withdrawn The plaintiff was John Neville Newmarch a Hull rivet heater and he sought to recover damages for alleged negligence from Dr Martin Fleischer house surgeon at Hull Royal Infirmary who performed an operation on him in October 1936 Mr H Hylton Foster counsel for Newmarch said On behalf of the plaintiff I unreservedly and in the most unqualified manner withdraw every allegation of negligence made against the defendant in this case and I ask for an order for the payment out of court of the sum paid into court to the defendant's solicitor Mr Justice Goddard made an order that all proceedings should be stayed on terms endorsed on counsel's briefs and added that there would be a judge's order if necessary

Universities and Colleges

UNIVERSITY OF OXFORD

In Convocation on July 16 the Vice Chancellor Mr A D Lindsay presiding the honorary degree of D Sc was conferred on Dr Harvey Cushing C B Emeritus Professor of Surgery at Harvard University

The Public Orator Mr Cyril Bailey presented Professor Cushing as an illustrious surgeon who had performed more than 2 000 successful operations on the brain He was descended from a long line of doctors and obtained his medical degree at Yale After studying in Europe he returned home and maintained in his writings and proved by his actions the value of the very difficult operation on the brain which he himself once called The North West Passage of Surgery The fine services he had rendered during the great war were well known to all For nearly thirty years he was Professor first at Yale University and then at Harvard and many of his pupils were to-day famous An expert with the pen as well as with the scalpel he had written many technical treatises on the nerves the structure of the brain and the pituitary gland and for the layman the great life of Sir William Osler

The following medical degrees were conferred in Congregation presided over by the Vice Chancellor

D M —A D C Bell R R Bomford

UNIVERSITY OF LONDON

Brown Animal Sanatory Institution Committee

The Senate has received the report of the Brown Institution Committee for 1937 which records that the superintendent has continued his research on viruses and Dr Nathan Raw has continued his research in human and bovine tuberculosis Five lectures on A Comparative Study of Filter Passing Bacteria and Viruses were delivered as required under the will of the late Mr Brown At the hospital during the year 1 298 cases were treated as out patient thirty two as in patients and the number of operations performed was 311

Graham Legacy Committee

Dr A M H Gray has been elected chairman of the Graham Legacy Committee for the year 1937–8 The Senate has received the annual report of the Committee for the year ending August 1938 which states that the general purpose for which the Graham Fund was founded was to aid research in the school of advanced medical studies connected with University College Hospital The Graham Scholar is Mr C H Gray and Drs C Bolton G R Cameron M Maizels and F H Teale have received grants in aid of research from the Graham Fund Professor C R Harington F R S was reappointed Director of Research under the Charles Graham Medical Research Scheme for a period of one year from October 1

Regulations relating to exemption from the internal intermediate examinations in arts science engineering economics and commerce and from the first examination for medical degrees through the higher school examination of other universities (*Red Book* 1937–8 pp 89 345 489, 556 575 269) have been approved

In and after 1939 the examination for the academic post graduate diploma in bacteriology (*Red Book* 1937–8 p 610) will begin on the Thursday following the third Monday in June instead of the first Tuesday in July

Mr Philip H Mitchiner has been appointed a Governor of the West London Hospital Medical School for 1938–9

The syllabuses in inorganic chemistry physics and general biology for the first examination for medical degrees for internal and external students (*Red Book* 1937–8 pp 264–7 *Blue Book* September 1937 pp 809–12) have been amended and copies can be obtained from the Academic and External Registrars

Geoffrey E Duveen Travelling Studentship

Applications are invited for the Geoffrey E Duveen Travelling Studentship of the value of £450 for research in any aspect of oto rhino laryngology The studentship is normally tenable in the first instance for one year part of which shall be spent in study abroad in accordance with a scheme to be approved by the Studentship Board but it may be extended for six months or for one or two years and during the extended period the student may be allowed to undertake research at the Royal Ear Hospital or some other laboratory approved for the purpose Full particulars can be obtained from the Academic Registrar University of London W C 1 and prescribed forms of application must reach him not later than December 31

William Julius Mickle Fellowship

Applications for the William Julius Mickle Fellowship are invited and must be sent in by October 1 The Fellowship is of the value of at least £200 and is awarded annually by the Senate to the man or woman who being resident in London and a graduate of the University has in its opinion done most to advance medical art or science within the preceding five years and has therein shown conspicuous merit Further particulars can be obtained on application to the Academic Registrar

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended July 9 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths, and of Deaths recorded under each infectious disease, are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

* After October 1 1937 puerperal fever was made notifiable only in the administrative county of London

† Includes primary form in figures for England and Wales London (administrative county) and Northern Ireland

EPIDEMIOLOGICAL NOTES*

Enteric Fever

During the week under review 13 cases of enteric fever were notified in England and Wales as compared with 26 in the previous week Of these 2 (5) were in London—1 each in Camberwell and Paddington In Scotland 4 cases of typhoid fever were recorded—1 each in Lanark County Glasgow Edinburgh and Roxburgh County—and 2 cases of paratyphoid fever both in Ross and Cromarty County There were 5 cases of enteric fever reported in Eire during the week under review the same number as last week and 4 (0) cases in Northern Ireland

Diphtheria and Scarlet Fever

Notifications of diphtheria in England and Wales during the week under review rose from 943 to 1 001 but in London they fell from 140 to 127 There was a marked decrease in the notifications for Scotland—151 as against 176—but in Eire there was an increase of 5 over 44 recorded last week while in Northern Ireland the figure remained at 21 Deaths from diphtheria in the 126 Great Towns of England and Wales remained at 22 and in London at 2 Of the 22 deaths recorded in the 126 Great Towns 3 each occurred in Leeds (0) and St Helens (0) There were 4 deaths from diphtheria in the 16 principal towns of Scotland during the week under review—1 each in Glasgow (2) Edinburgh (0) Dundee (1) and Clydebank (0) There was an increase in the number of notifications of scarlet fever in England and Wales during the week—1 751 as against 1 641—and in London—157 as against 152 in the previous week In England and Wales the figures were in excess of the median value for the last nine years but in London they were appreciably less There were 2 deaths from scarlet fever in the 126 Great Towns of England and Wales during the week under review the same as last week no deaths from scarlet fever were recorded for London Notifications for Scotland fell from 361 to 295 with 2 deaths while in Eire and Northern Ireland they fell from 88 to 73 and from 78 to 71 respectively

Primary and Influenzal Pneumonia

The seasonal fall in the notifications of primary and influenzal pneumonia continues the figures for England and Wales dropping during the week from 622 to 500 this figure is well below the median value for the last nine years In London the fall in the number of notifications is very slight the number notified being the same as the median value

Measles and Whooping-cough

During the last few weeks the deaths from measles in the 126 Great Towns of England and Wales have fallen from about 12 to 8 of the 7 deaths registered during the week under review 3 were in London The number of cases reported in the L C C elementary schools has fallen rapidly the figures for the last four weeks being 680 422 348 and 250 (week under review) while the average daily admissions to the L C C fever hospitals fell by one third compared with the previous week Notifications dropped in three of the metropolitan boroughs in which measles is notifiable remained the same in two and rose in six—Battersea 23 (18) Finsbury 10 (8) Hampstead 10 (6) Lambeth 31 (17) St Pancras 18 (15) Stepney 6 (5) In Scotland measles is also on the wane 91 cases being notified compared with 113 in the previous week Dunfermline Kirkcaldy and Falkirk were the chief towns involved

Whooping-cough in Scotland has replaced measles as the principal killing infectious disease compared with 1 death (in Glasgow) from measles there were 5 deaths from whooping cough—2 in Glasgow and 1 each in Greenock Hamilton and Paisley In Eire 2 deaths from whooping cough were recorded both in Dublin and in Northern Ireland 1 death was reported in Lurgan

Notice was given in the *London Gazette* of Friday July 15 of regulations making measles and whooping cough compulsorily notifiable in the County of London These regulations which are made under the Public Health Act, 19 6 come into effect on October 1 Notification is restricted to the first case occurring in the same house or institution within a period of two months in this way the occurrence of the e di ea es is brought to the notice of borough medical officers of health who will be able to supervise contacts and have the earliest warning of the development of further cases Current practice in London and the expected effect of general compulsory notification were dealt with in the *Journal* of April 9 (p 807) A possible development the scope of which cannot be determined at present is that active immunization of contacts by means of specific vaccines may be carried out by the co operation of medical practitioners with borough medical officers of health

Cholera

The epidemic of cholera in Hong Kong continues although the number of cases reported for the week ended July 9—225—was 76 less than in the previous week In Hong Kong in the same week there were 45 cases with 32 deaths Cholera first made its appearance in Hankow during the week ended June 25 and although no details are available as to its incidence since the outbreak is likely to spread on account of the large number of refugees in that city and of the military operations proceeding on the Yangtse River In French Indo China and in British India generally a downward trend of the disease has been noted in recent weeks except in the Central Provinces and in Berar where a fresh wave occurred during the week ended July 9 after a period of decline lasting three weeks

Typhus

The incidence of typhus in Morocco has been falling in recent weeks 66 cases with 10 deaths were reported in the week ended July 2 compared with 71 in the previous week In Tunisia 55 cases were notified compared with 76 in the previous week and in Egypt there were 42 cases in the provinces 1 in Cairo and 1 case with 1 death in Alexandria

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

Medical News

Lieutenant Colonel W L Harnett C I E M D F R C S I M S (ret) former professor of surgery Medical College of Calcutta and recently reader in surgery at the British Postgraduate Medical School has been appointed medical secretary to the Clinical Cancer Research Committee of the British Empire Cancer Campaign The scheme of clinical cancer research which has already started will embrace approximately 17 000 fresh cases of cancer annually occurring in the teaching hospitals and the specialized hospitals of the London area and the hospitals of the London County Council and the Middlesex County Council

We are asked to announce for the information of general practitioners that the out patient department of the Chelsea Hospital for Women is closed now for new patients until the first week in September

Mr A N Dixon has been appointed to the position until recently held by Mr P N Adamthwaite as agent (manager) of the Medical Insurance Agency Mr Dixon will take up duty on September 5

The American Association for the Study of Goiter will hold its annual meeting for the year of 19 8 in conjunction with the third International Goiter Conference in Washington D C on September *12 13* and *14* The programme for the first day will consist of the presentation of papers concerning endemic goitre the second day will be devoted to a study of the thyroid in relation to endocrinology and metabolism and the third day will be given up to hyperthyroidism These subjects will be discussed by workers from several different countries

The *fifth European Congress* of Mental Hygiene organized by the committee of mental hygiene of the Association of German Neurologists and Psychiatrists will be held at Munich from August 22 to 25 Further information can be obtained from 80 Rue de Levourne Brussels

QUERIES AND ANSWERS

Case for Diagnosis

Dr T STACEY WILSON (Birmingham) writes in reply to Fag (*Journal* July 9 p 105) With regard to the patient mentioned by Fag the history of the case makes it quite probable that the colic is a referred pain due to fibrositic thickening irritating an intercostal nerve which is in relationship to the skin area in which the pain is felt If this be so destruction of the fibrositic tissue by forcible massage will free the patient from pain If forcible massage over one of the ribs induces pain next day over the area where the pain is usually felt destruction of the fibrositic tissue is certain to cure the condition This subject is dealt with in an article of mine in the *Journal* of February 15 1936 (p 298)

Income Tax

Army Pay While Abroad

Captain R A M C was living abroad up to June 17 when he returned to this country Between April 6 and June 17 he remitted £100 to the United Kingdom, his wife was here but he maintained no residence here Is he liable to United Kingdom income tax as well as Indian income tax on the £100?

*** Yes He is a British resident for the financial year commencing April 6 1938 and is liable on pay received in or remitted to this country He is however entitled to Dominion Income Tax Relief in respect of the tax paid in India on income assessable also in the United Kingdom The working of that relief is somewhat complicated, but it will probably recoup him for at least one half of the relative Indian tax

LETTERS, NOTES, ETC

Lunatics as Pets

This is the bizarre title of an article by Dr Claude Lillingston in the July number of *Blackwood's Magazine* Behind the story of a plucky old lady who preferred a lunatic to the conventional pet—asthmatic dog mangy cat or twittery canary—is a plea for home rather than hospital treatment for certain cases of mental disorder The heroine of the story taken from life was a lone widow who had just settled into a cotton wool with hot bottle nest of her own when she received an S O S from an old friend whose relations had deposited him in a mental institution She proceeded forthwith to dig him out of it and install him as the guest of honour in her own home His joy was boundless And might he have a razor? Razors had of course been taboo in the asylum Without a moment's hesitation his hostess supplied him not with one but with all the seven razors her husband had owned—one for every day of the week To the warning that her guest might cut his throat she retorted with charming elliptical logic that she had never heard of any lunatic being so deft that he could slit his throat with seven razors The guest was allowed to come and go as he pleased, and the neighbours were free to make their own comments when her guest was shepherded home by some policeman making good the lunatic's temporary loss of memory This story of what may have been a case of early senile dementia is a timely reminder of the inability of some people whether they are sane or insane to appreciate institutional life however perfectly organized—people to whose angular individualism the very perfection of a well organized community may be anathema After confessing that he does not know how this story ended because he had not kept in touch with the lady and her pet, the author asks if the keeping of lunatics as pets may not be a far more common practice than most of us realize he even goes so far as to suggest that the world is full of such combinations and that in some cases there may be doubts as to who is the pet and who is the keeper thereof

Bed-bug in the Human Ear

Dr C E ELLIOTT (London S W 7) writes I have read with interest the note by my colleague, Dr N Vere Hodge (*Journal* June 25 p 1406), regarding a bed bug which he dislodged from the ear of a patient Let me assure him that his experience is not unique I well remember two of these creatures reminiscent of the man eaters of Tsavo who conducted nightly forages from the same diurnal retreat—one in each ear It was some weeks before we could locate them Bed-bugs sometimes choose curious hiding places In his recent autobiography Noel Coward records a nest of these creatures, which was finally traced to an embroidered picture

Qualifications for Caretaking

"C B H" writes Practitioners of physical medicine have frequently been accused of various forms of ju-ju but the following extract from a reply to an advertisement for a man and wife to act as doorman and looker after 'of my instruments may perhaps only be personal to myself—and not significant of an inside knowledge of the subject I was also employed as post mortem attendant during which time I have prepared as many as five bodies in a day (removing all viscera etc) for the demonstrating pathologist so I am sure that you would find me suitable for the position of caretaker, etc, and handyman'

Holidays and the Milk Supply

Dr C O Hawthorne, chairman of council and Miss Olga Nethersole, founder and organizer, of the People's League of Health have sent the following letter to the Press May we as in the past, give a word of advice to holiday makers? Holidays means change in surroundings habits, occupation and food At home the food supply is under the control of the housewife, who has learned by experience to know where reliable foods can be obtained The holiday changes this position, and the family supplies are under a new supervision Quite likely this supervision is in general satisfactory None the less it is well to be on the safe side for a holiday which leads to illness is an unhappy experience The milk supply in this respect is particularly important At a well-known holiday resort some eighteen months ago there was an outbreak of typhoid fever which caused fifty one deaths including those of a number of summer visitors All the primary cases were traced to an infected milk supply, and of great significance is the official announcement that when the milk was pasteurized the epidemic ceased The lesson is obvious To avoid risk drink only pasteurized milk or if this cannot be obtained protect yourself and your family by heating the milk to boiling point Everyone recognizes the food value of milk especially for children Yet raw milk means some degree of risk Pasteurization or boiling on the other hand means safe milk and milk of full food value There is an old adage Prevention is better than cure Here is a chance to apply it

KEY TO CURRENT MEDICAL LITERATURE

GENERAL JOURNALS

Bulletin of the Johns Hopkins Hospital

Baltimore vol 63 April 1938

Symposium on Johns Shaw Billings by E L Heume A M Chesney S V Larkey and H M Lyderberg

Action of Insulin on Convoluted Renal Tubules—E J Boyce
Low grade Partial Obstruction of Small Intestine—L Martin and H F Wright
Studies on Immunizing Substance in Pneumococcus (VI)—L D Felton and G K Huffman
Congenital Universal Insensitiveness to Pain—F R Ford and L Wilkins

Regional Ileitis and Ulcerative Colitis—Ten cases of regional ileitis and three of ulcerative colitis in association with lymphogranuloma are discussed. The similarity of the clinical features is noted. The possibility is considered that the virus of lymphogranulomata may cause the ulcerative lesions in the colon and that the lesions of regional ileitis may also be due to a virus.

Insensitiveness to Pain—Three cases are reported of children *in whom there was a congenital indifference to painful stimuli* leading in one case to severe burns, multiple fractures and other serious injuries. There was no other evidence of defect of the nervous system. It is thought that these cases represent a defective development of the sensory system involving selectively the pain mechanism and comparable to congenital colour blindness and similar conditions.

Hemicrown Tea Species—C Mayer

Asthma—An account is given of the experiences of a hospital in Budapest with regard to asthma in old age the clinical picture being described and the differential diagnosis discussed.

Malign Sclerosis—This study which comes from Santiago *de Chile and was undertaken at the State University* Medical Hospital deals with twelve cases of malign sclerosis in ten of which the patient's age was under 50 with 100 cases of benign nephrosclerosis and forty cases of malign nephrosclerosis. The three chief manifestations of malign sclerosis are high arterial pressure a poor general condition and albuminuric retinitis.

Venereal Lymphogranuloma—W Frei
Phenolphthalein Studies—B Fantus and J M Dyniewicz
Nature of Bleeding in Jaundice—A J Quick
Vitamins in Relation to Prevention and Treatment of Pellagra—W H Sebrell

Vascular Birthmarks—Cavernous haemangiomata and other vascular naevi occurring in infants and young children are often left alone because the usual methods of treatment are unpractical expensive or require special facilities. Kaessler recommends the injection of sclerosing solutions superficially into the vascular mass. Contiguous areas of blanching are produced by 0·1 to 0·2 c.cm. of solution. Sloughing occasionally occurs but heals with little scarring. Several treatments may be required if the area is large.

Cardiazol Test in Epilepsy—The intravenous injection of 2·0 to 2·5 c.cm. of a 10 per cent. solution of cardiazol releases an attack only in patients suffering from epilepsy. In some cases of epilepsy it was necessary to increase the dose in order to release an epileptic attack. On the other hand doses of 3 c.cm. may release convulsive attacks in schizophrenia, mental deficiency, and in the hebephrenic psychopathies. In neuro- and psychopathic individuals the test except in a few complex cases remained negative.

Traumatic Functional Disturbances of Iliopsoas Muscle—K. Herzog
Mode of Action and Clinical Importance of New Group of Central Analeptics—H. Eitel
New Fermentation Apparatus for Examination of Faeces—A. v. Hatasz

Blood Alcohol—Huber's thesis is that a clinical diagnosis of drunkenness by an examination of the reflexes, gait, speech, memory, concentration, and general attitude is fallible. A chemical examination of the blood is more scientific and exact. The presence of one to three parts of alcohol per 1,000 parts of blood gives rise to varying manifestations depending on the tolerance of the patient to alcohol.

Policlinico

Rome vol. 45 May 9 1938 (Sez. Prat.)

*Experiments with Precipitating Bacterial Extracts of Krumwiede and Nobel—A. Alessandrini
*Treatment of Malarial Splenomegaly by Maurizio Ascoli's Method—S. Liverato
Leptomeningeal Haemorrhage in Young Female—G. Dalla Torre

Precipitating Bacterial Extracts—Alessandrini recalls the method of bacterial extraction used by Krumwiede and Nobel for typing pneumococci in sputum. He has found that such extractions of organisms of the typhoid and *B. coli* groups give specific precipitation reactions with commercial antisera or the sera of convalescents. The method cannot be applied to the detection of acid-resistant bacilli or in brucellosis. The extracts are stable.

Malarial Splenomegaly—Liverato describes (1) his own and numerous similar recorded successes in the treatment of the splenomegaly of chronic malaria, and (2) successes obtained by others in acute malarial recurrences and in kala-azar by Ascoli's treatment. This consists in a protracted series of intravenous injections of adrenal extract in extremely small doses (derisory according to Ascoli). The treatment was found to be innocuous and to lead to an increase of weight and a very notable improvement in the anaemia.

Paris vol. 46 May 11 1938

Splanchnic Ganglionectomy and Diabetes—H. Chabanier, J. Bréhant, and R. Donaso
*Asthma and Menstruation—F. Claude and R. A. Vall

Asthma and Menstruation—The authors give brief accounts of thirty-six cases in which asthmatic attacks appear to have been definitely related to the patient's menstrual history. Many of these patients were improved by the administration of follicular hormone and corpus luteum extracts. They conclude that these pre-menstrual or menstrual attacks of asthma are probably the result of a disturbance of the already unstable vago-sympathetic system due to vitiation of the secretions of the ovaries or other endocrine glands.

Treatment by Sulphoamido-substances—A. Alder and N. Markoff
Types of Diphtheria Bacilli—E. Wissler

Protamine-zinc-insulin—Hypoglycaemic symptoms are less frequent under treatment with protamine-zinc-insulin than with ordinary insulin, but harder to recognize and of greater severity. The error of using protamine-zinc-insulin in large doses in ambulant treatment is pointed out together with the necessity for giving instructions for reduced dosage before engaging in games or protracted muscular exertion. The scope of the treatment is discussed and pronounced to be decidedly limited. The use of protamine-zinc-insulin in patients long accustomed to ordinary insulin is not deemed advisable.

Influence of Complications on Effectiveness of Mandelic Acid in Treatment of Pyuria —P Hum
Determination of Sulphanilamide in Blood and Urine Account of a Micromethod —E Lundsteen E Vermehren and M Vermehren
Form-determination Test of Rorschach Its Employment in Practice —V Bratt

Male and Female Gonorrhœa.—Throughout Denmark between 1906 and 1936 the incidence of gonorrhœa between the ages of 15 and 65 shows a remarkable change in the relative numerical importance of the disease in the two sexes In the male population its incidence per 1 000 has fallen by 16 per cent whereas in the female population it has risen by 41 per cent The author discusses the various causes apparent and real of this phenomenon He attaches considerable importance to the change in the attitude of women towards promiscuous sex relationships

Sulphanilamide in Blood and Urine.—The rapid absorption of sulphanilamide when given by the mouth suggests the desirability of giving it frequently and in small doses if its concentration in the blood is to be maintained at a fairly constant level An initial large dose of say 2·4 grammes might be followed by small doses of 0·6 gramme given five times in the twenty four hours When the functional capacity of the kidneys is under suspicion it is well to control the excretion of sulphanilamide in the urine in the hope of avoiding sulphanilamide poisoning

Carcinoma of Pancreas and Extrahepatic Ducts —Henry K Ransom
Complications of Gall bladder and Stomach Surgery —H M Clute and H Albright
Pyogenic Abscess of Liver —A. Ochsner *et al*

Liver Function.—This is an evaluation of the biochemical tests available for the estimation of liver function The glucose and laevulose tolerance tests are shown to be of *relatively little value* Attention is drawn to the value of the estimation of hippuric acid in the urine following the administration of benzoic acid by mouth

Acute Gangrenous Cholecystitis.—The author reviews in some detail the end results and the fate of the remaining portion of the gall bladder following partial cholecystectomies

Acute Pancreatitis.—This is a comprehensive discussion of the diagnosis of this condition with especial reference to the value of the blood amylase test

Carcinoma of Head of Pancreas and Extrahepatic Ducts.—The author reviews here 109 cases, contrasting the symptoms and the results of treatment

Annales d'Hygiene publique, Industrielle et Sociale

Paris vol 16 May 1938

Organization of Hygiene Offices in Department of Seine —E. Malespine.
Soiling of Towns by Dogs —M Clerc
Social Scourges of the Navy —D Vauche

Retrospective Test for Exanthematous Fevers —P Giroud

Naval Scourges.—A review of the part played by the social diseases —tuberculosis venery and alcohol—in the French Navy followed by a discussion of administrative and practical methods of prevention control and after care

Annales de l'Institut Pasteur

Paris vol 60 April 1938

Studies of Microbiology of Soil and Water IX Morphology and Oecology of Azotobacter—S Winogradsky
*Morphology of Herpes Virus in Tissues of Experimentally Infected Animals Formation of Inclusion Bodies so Produced—S Nicolau and L Kopciowska
Contribution to Study of Tuberculin Allergy in Children—R Chaussinand
Histopathological Changes in Nervous System of Rabbits in Experimental Infection with Virus of Equine Encephalomyelitis—J Jabotinski

Herpes Virus Inclusion Bodies—In experimental herpetic lesions in the rabbit appropriate staining methods show large numbers of minute rod shaped bodies scattered diffusely or aggregated within cells either in the cytoplasm or within the nucleus These are believed to be particles of the virus They have been found in both nerve cells and glial cells in experimental encephalitis in the cornea and skin after inoculation in these situations in the skin lesions of herpes zoster in man and spreading in peripheral nerves when the nerve itself is inoculated The inclusion bodies characteristic of this infection appear to be formed by the agglutination and fusion of these colonies of the virus

Tuberculin Allergy—This is a record of the early effects of prophylactic treatment with B C G in children in French Indo China Sensitivity to tuberculin develops regularly within two months when B C G is given subcutaneously, but more slowly and sometimes not at all when the oral route is used In either case it is transitory diminishing and finally disappearing within two to five years Children so treated and exposed to household infection usually remain persistently and strongly tuberculin-positive, but in some such cases the reaction remains negative The author believes that in these cases the inevitable infection with virulent bacilli has assumed a modified form harmless in its consequences and unaccompanied by allergy

Annals of Surgery

Philadelphia vol 107 April 1938

Post-anæsthetic Encephalopathy following Cyclopropane—P W Gebauer and I I Coleman
Degeneration of Brain following Nitrous Oxide Anaesthesia—J D O'Brien and A F Steegman
Brain Abscess of Undetermined Aetiology—J C Yaskin F C Grant and R A Groff

Nystagmus Postrotatorius II as Clinical Method of Examination—R Mittermaier
Anatomy and Function of Labyrinth in *Meerbrassen* (*Sparidae*)—A Denker
*Origin of Primary Carcinoma of Middle Ear—J Berendes

Osteomyelitis of Nasal Origin—The author describes seven cases of osteomyelitis of nasal origin, six of which were cured after extensive operations The clinical features surgical treatment and pathology of this rare condition are fully discussed Apffelstaedt stresses the importance of radiography in diagnosis

Movements of Vocal Cords—These were studied in freshly killed calves, and a few observations were also made on human specimens The authors used a photographic method in which a strong light was placed below the glottis and the light transmitted through the glottis was photographed on a moving plate, thus making records in the form of curves The vocal cord movements were produced by bellows attached to the tracheal end of each larynx studied

Middle-Ear Injury by Caustics—The author describes two rare cases where caustic poisons which had been swallowed reached the middle ear by way of the Eustachian tube during the act of vomiting The physiology of the muscles of the Eustachian tube and soft palate is discussed

Primary Carcinoma of Middle Ear—These malignant tumours are always of the squamous celled carcinoma type although the lining of the middle ear is of columnar epithelium The explanation usually given is that malignant disease in this region is always preceded by chronic middle ear suppuration, there is an ingrowth of the stratified epithelium of the meatus into the middle ear, or a metaplasia of the epithelial lining of the tympanic cavity The author describes one case in which the new growth was not preceded by chronic suppuration, yet it was a 'squamous epithelioma' He concludes that carcinoma of the middle ear must be looked upon as arising from the epithelium of the external auditory meatus

Further Observations on Familial Periodic Paralysis—E N Allott and B M Ardle
Effect of Adrenaline on Serum Potassium Level in Man—L J M Castleden

Effects of Asphyxia on Sensation—Touch cold sense warm sense and fast conducted pain all begin to fail at approximately the same time when the limb is asphyxiated Slow conducted pain fails later and is preceded by hyperalgesia Nerve fibres do not fail in order of their conduction rates Injury to a digital nerve produced hypoaesthesia and hyperalgesia which were accentuated by warming and diminished by cooling the site of injury

Renin—Extracts of renal cortex when injected intravenously into unanæsthetized rabbits produce a prolonged rise of blood pressure Two methods of preparation of such extracts are described and an account is given of some chemical and physical properties of the active principle renin Assay of renin is accomplished by comparing the pressor effect of a given extract with that of a standard extract

Familial Periodic Paralysis—The observation that attacks of familial periodic paralysis are associated with a fall in blood potassium and that such attacks are relieved by the administration of potassium is confirmed The level of blood potassium at which attacks appeared varied in different cases low values in normal subjects were not associated with any muscular weakness It is suggested that the cause of the attacks is some muscular mechanism which is abnormal either quantitatively or qualitatively and which involves hexose phosphate

Influence of Inflammation on Absorption of Substances of Varied Diffusibility — R G Miller
*A Stable Haemolysin leucocidin and its Crystalline Derivative Isolated from Beta haemolytic Streptococci —E J Czarnetzky I M Morgan and S Mudd

Active Immunity to Experimental Poliomyelitis —Intranasal instillation of poliomyelitis virus in the monkey, if it fails to produce an attack of the disease, gives rise to no immunity If the virus is introduced after the previous instillation of pituitrin and a mixture of adrenaline and ephedrine sulphate infection of the central nervous system does not follow and immunity sometimes results, being indicated by resistance to subsequent inoculation either intranasal or intracerebral, and by the demonstration of protective antibody in the monkey's blood The instillation of the drugs used caused no demonstrable change in the nasal mucosa other than a slight inflammatory reaction in which eosinophils were prominent

Japanese B Encephalitis Virus —The authors studies of the pathogenicity of Japanese B encephalitis virus for various animals confirm the observations of others that it is distinct from the St Louis encephalitis virus Its behaviour in animals is similar to that of louping ill virus but these two can be distinguished serologically Although the nasal mucosa is usually assumed to be the portal of entry of these infections, contact spread does not occur among animals

Stable Haemolysin leucocidin from Beta haemolytic Streptococci —From strains of *Streptococcus pyogenes* belonging to four of Lancefield's groups but in no case from several other bacteria a chemically pure substance has been extracted having the properties of a haemolysin and a leucocidin Its sodium salt has been obtained in crystalline form This substance retained its activity for a year when kept under sterile conditions resisted boiling and was unaffected by moderate degrees of acidity or alkalinity It haemolysed up to a dilution of 1 in 128,000 and this effect was not prevented by immune serum serologically the substance behaved as a haptene It was highly toxic for animals Its molecular weight has been determined (2260) and its structure ascertained sufficiently to assign it a tentative formula ($C_{11}H_{11}O_{11}N$ P)

Meniere's Disease Study based on Examinations Before and After Intracranial Division of Vestibular Nerve —S J Crowe
Clinical and Experimental Results with Thorotrast —D L Reeves and R M Stuck
*Pathological Physiology of Chronic Cardiac Decompensation —M D Altschul

Chronic Cardiac Decompensation —This review is divided into two parts In the first the physiological mechanisms involved in cardiac decompensation are considered, and the validity of the available data concerning these mechanisms is discussed In the second part the cardinal signs and symptoms of congestive cardiac failure are interpreted in the light of this physiological knowledge A convincing case is made out for the view that each of the cardinal signs depends not on one but on several physiological mechanisms being deranged The author does not sponsor any particular theory of cardiac failure but presents a judicial consideration of the best of the evidence available on this subject

Le Nourrisson

Paris vol 26 March 1938

*Researches on Contagiousness of Pulmonary Tuberculosis in Young Children — E Lesné G Dreyfus Sée and A Saenz
Sugar free Milk Concentrates —P Lassablière

Contagiousness of Pulmonary Tuberculosis —The authors emphasize the possibility of contagion from infants and young children who harbour a primary tuberculous lesion The stomach washings from children who showed clinical or radiological evidence of tuberculosis were examined and a high proportion contained tubercle bacilli The possibility of infection from these children is evident and such children should be segregated from healthy ones The authors however consider that contagion is likely only in young children of low resistance

Public Health

London vol 51 April 1938

Present Practice in Regard to Quarantine and Disinfection—Hugh Paul
Study of Health Relationships in Group of Supervised Pregnancies and Resulting Infants—Agnes Neill
Scarlet Fever and Diphtheria Immunization in Urban District of Waterlooville with Seaforth—W J Cover

Quarantine and Disinfection—The balance of probability of infection of children at home and in school is discussed. Routine exclusion of contacts from school is deprecated and experience in Smethwick is described. Terminal disinfection gives a false sense of security and should be replaced by supervised soap and water cleansing.

Supervised Pregnancies and Infants—A study based on the records of 428 mothers and their infants attending the Willesden ante-natal clinic and welfare centre. A summary of the factors that influence the type of infant (health and behaviour) is given.

Scarlet Fever and Diphtheria Immunization—A statistical account of the practice of immunization in an urban district with an ingenious profit and loss statement of the saving of the rates effected by the prevention of probable cases.

Cholera Plague Smallpox Typhus and Yellow Fever

Meningococcal Meningitis—This is a review of the serum therapy of this disease since Jochmann's experiments in 1906 followed by a criticism of methods and technique in the preparation and application of sera. A comparison with the results of drug treatment (the sulphanilamides) is made and also some suggestive and promising reports of the results of combined treatment. An extensive bibliography (22 references) is appended.

Trichinosis—This is a detailed description of the methods and apparatus used. By a combined method (microscopy and digestion) agreement was secured in only one third of the cases. Classified results of the 174 positive cases are given.

Precipitated Pertussis Vaccine—A commercially prepared pertussis vaccine was precipitated with alum and the precipitate resuspended in saline solution to the original volume. One dose of 1 c.cm. was given to each of eighty-two children who were observed against a corresponding group of unvaccinated children for one year. Injection reactions were negligible. In the control group 19 per cent. developed clinical pertussis and in the vaccinated group 12 per cent. with a preponderance of mild cases. The observed differences are regarded as inconclusive but sufficient to justify a large-scale investigation which is being undertaken.

Experimental Study of Effect of Irradiation on Acute Pyogenic Infection of Skin and Subcutaneous Tissues—J Soto A Brunschwig and F Schlutz

Chronic Empyema Cavities—In this article Carter emphasizes the fact that adequate drainage by the resection of long segments of several ribs and wide exteriorization of the empyema cavity is the most important step in the treatment of chronic empyema. Attention is drawn to the advantage of using pedicled muscle flaps in the closure of the chronic empyema cavity that remains after drainage has been carried out.

Meckel's Diverticulum—The difficulty of making a positive diagnosis of a diseased Meckel's diverticulum is pointed out. The lesion is described as a developmental anomaly of the intestinal tract which affects about 2 per cent. of the population although only about one fourth of all cases show definite symptoms. A review of twenty consecutive cases is given and two are fully described. Cases are divided into three classes according to their symptoms and treatment depends on the group to which each case belongs. There are those cases in which no symptoms or signs are present, those with symptoms or signs of intestinal obstruction, and a third group in which symptoms and signs of intestinal bleeding are present.

Hallux Valgus.—H. Stein.
Value of Divided Single Pedicle Skin Flap in Plastic Repair of Scalp.—W. Davis.
Carcinoma of Bronchus. Clinical and Pathological Study of 164 Cases.—J. Stein and H. Jolin.
Skeletal Distraction of Tibia.—D. Bosworth.
Operability in Cancer of Rectum.—T. Jones.
Transvesical Diathermy in Treatment of Carcinoma of Bladder.—V. Randall and C. Uhle.

Endocholedochal Sphincterotomy.—Attention is drawn in this article to the relationship between disorders of the biliary tract, the pancreas and the gall-bladder and physiological disturbances of the sphincter of Oddi. The different methods of relieving spasm of this sphincter are described and their relative values discussed. A case is fully reported in which periodic attacks of sphincter spasm were relieved by endocholedochal sphincterotomy.

Zeitschrift für Geburtshulfe und Gynakologie

Stuttgart vol. 117 April 29, 1938

Thirteen Cases of Malignant Chorion Epithelioma.—H. Heuck and R. Hauser.
Connexion between Growth of Carcinoma and Endocrine.—Hans Burtz.
Results of Operative Treatment of Prolapse.—Kurt Hollstein.
*Interstitial Tubal Pregnancy.—Herbert Huber.
Oedema of Newborn.—H. Volz.
Ascorbic Acid Content of Human Milk in Summer and Winter.—H. Winkler and A. Heim.

Interstitial Tubal Pregnancy.—Seven cases of interstitial tubal pregnancy are described. The condition is uncommon but is of interest with regard to aetiology. The author found that contrary to general experience with pregnancy occurring in other parts of the Fallopian tube there was no evidence of nodose salpingitis but that uterine decidua was present in the tubal capillaries.

Sensation and Image in Seeing and Hearing.—O. Goebel.
Psychopathology of Dream in Schizophrenic and Organic Psychoses.—M. Bos.
Problem of Solar Influence on Psyche.—B. and T. Dull.

Colocynth Polyneuritis.—Kroll reports a case of polyneuritis affecting both legs in a woman who had taken colocynth for over a year as a purgative. The illness ran a favourable course.

Problem of Solar Influence on the Psyche.—B. and T. Dull have attempted to test the effect of solar eruptions on the psyche by examining the frequency of suicide in a number of large European cities day by day and correlating it with observed solar phenomena. Their findings are in support of a belief in such an effect though statistically not beyond the bounds of what might be interpreted as a chance effect.

*Bacteriological Meat Inspection.—G. Pohl.
Experimental Feeding Tuberculosis in Swine.—A. Hemmert-Halswick and E. Hennicke.
Course of Active and Active-passive Immunity in Tetanus.—K. L. Wolters and H. Dehmel.
Value of Experimentally Infected Guinea-pig for Recognition of Infectious Anaemia in Hoofed Animals.—H. Wittfogel.

Bacteriology of Meat.—Cultures were made of various organs from 16,331 carcasses of animals which had either been 'emergency-slaughtered' or were otherwise suspect; bacteria of the Salmonella group were recovered from 269. The sites from which positive cultures were most often obtained varied somewhat in different animals but the liver, gall-bladder, lymph nodes at the hilum of the liver, and sometimes the spleen were generally speaking the most often infected. Enrichment in tetrathionate broth sometimes gave positive cultures when other methods failed.

Form and Function of Feet of Mountain Nomads of Anatolia.—Ismak Sadi.
Eumycosis in Orthopaedic Surgery.—F. Holldack.

Spontaneous Cure of Congenital Dislocation of Hip.—In a series of 128 cases of congenital dislocation of the hip spontaneous cure was found to have occurred in ten (twelve joints). This surprisingly high proportion (8 per cent.) makes it likely that such cases occur more frequently, at least in Japan, than has hitherto been assumed. The cases are described.

Zeitschrift für Tuberkulose

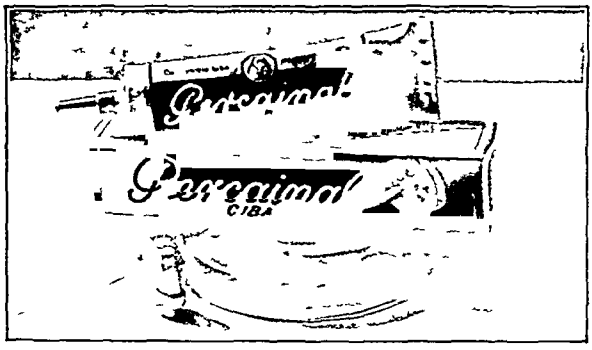
Leipzig vol. 79 May 1938

Hans Dekker (obituary).—F. Redeker.
Biological Hereditary Research in Tuberculosis.—W. Seiffert.
*Influence of Extracts of Organ on Evolution of Experimental Tuberculosis.—A. S. Jeans.

Organ Extracts and Tuberculosis.—This is a long and well-illustrated paper. The experimental findings lead the author to offer the tentative conclusion that in those suffering from tuberculosis associated with anaemia liver extracts should be administered with caution and never in large doses.

In the treatment of MACROCYTIC ANAEMIAS

This palatable liquid extract of hog s stomach contains Hæmopoietin in stable solution The stomachs are treated immediately after killing to extract the *Antianæmic Factor in active condition* producing a bland liquid of pleasant flavour to which the name **HOGASTRIN** has been given



A dose of two teaspoonfuls in a little water three times a day for a fortnight then reduced to one teaspoonful will invariably give good results in the treatment of all *Macrocytic Anæmias*

Packed in 4 oz 8 oz and 16 oz bottles

For inspection sample and literature apply to the manufacturers

APPOINTMENTS—Contd

ST JOHN'S HOSPITAL LEWISHAM S.E.1

Applications are invited from registered medical practitioners to fill the office of CLINICAL ASSISTANT to the Medical Officer in Charge of the Electrical and Massage Department. The successful applicant will be required to attend the hospital on three half-days a week and honorarium of 8 guineas per annum.

Applications should be received by the undersigned who will be pleased to give further particulars.

J. C. GILBERT
Secretary Superintendent

GENERAL LYING IN HOSPITAL
York Road Lambeth S.E.1

Applications are invited for the post of REGISTRAR. Preference will be given to those candidates who possess the qualifications of F.R.C.S. (Eng.).

Applications with copies of three testimonials to be sent not later than July 29th 1938 to the Secretary.

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN
St Quintin Avenue North Kensington W.10
(Ladbroke 0133)

The Board of Management invite application for the post of HONORARY ASSISTANT PHYSICIAN with beds.

Applicant must be graduates of a University and must hold the M.R.C.P. (London) and the successful candidate will be required to see Out Patients.

Applications accompanied by copies of three testimonials should be sent to the undersigned at the Hospital from whom any further information can be obtained and should reach him not later than July 30th 1938.

H. J. ELEY
Secretary

ROYAL LONDON OPHTHALMIC HOSPITAL (MOORFIELDS EYE HOSPITAL)
City Road E.C.1

Applications are invited for the post of OUT PATIENT OFFICER to attend on Tuesdays and Fridays (morning) each week.

Candidates must be registered Medical Practitioners.

Salary at the rate of £110 per annum. The Out patient Officer will be appointed for a period of one year and will be eligible for reappointment.

Copies of regulations can be obtained on application.

Applications with testimonials stating age and if married with photograph only must be received by the undersigned not later than August 3rd 1938.

A. J. M. TARRANT
Secretary

MILDMAY MISSION HOSPITAL
Mildmay Street Bethnal Green E.2

Applications are invited for the post of ASSISTANT CASUALTY OFFICER (female) which becomes vacant on September 1st 1938. The appointment is non-resident and for six months. Salary £125 per annum. Dinner tea and supper when on duty.

Candidates must be registered under the Medical Act and the Mildmay Council must be satisfied that they should be fully in sympathy with the religious work of the Hospital.

Application with copies of recent testimonials should be sent to the Medical Superintendent as soon as possible.

Valentine's Meat-Juice

In Typhoid Fever, Diarrhoea and Cholera Infantum, when it is Essential to Sustain the patient without irritating the Digestive Organs, the Ease of Assimilation and Power of Valentine's Meat-Juice to Restore and Strengthen has been demonstrated in Hospital and Private Practice.

THE quickness and power with which VALENTINE'S MEAT-JUICE acts, the manner in which it adapts itself to and quiets the irritable stomach, its agreeable taste, ease of administration and entire assimilation recommend it to physician and patient

Physicians are invited to send for brochures containing clinical reports

For sale by European and American Chemists and Druggists

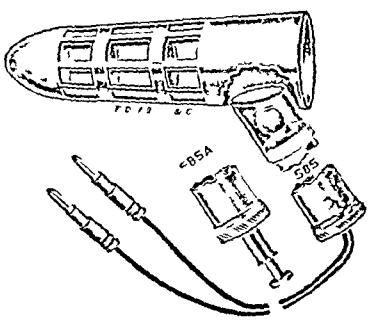
A FEW SPECIALITIES OF F. DAVIDSON & CO.



Makers of Optical and Electro-Medical Appliances (Estd 1890.)

143-149, GREAT PORTLAND STREET, LONDON, W.1

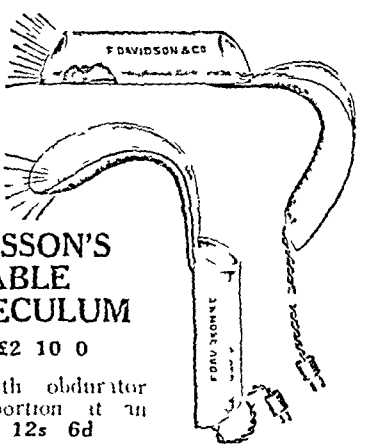
THE "DAVON" (REG TR MK) IMPROVED RECTOSCOPE

Suggested by Philip H Dalgleish Esq MP Chelsea who writes in the B M J

Having been dissatisfied for some time by all the various types of proctoscope on the market I have devised a model for use in the injection of haemorrhoids The advantages of this new model are that the whole operative field is visible at the same time that the haemorrhoids do not project into the lumen of the instrument and that there is no obdurator to cause discomfort to the patient and to be a nuisance to the operator The instrument has been made for me by Messrs F Davidson & Co who are supplying it with illumination from a battery in the handle or from a separate battery

No 585 With Washable Rubber Flex £2 15 0

'Davon' Dry Battery 0 7 6



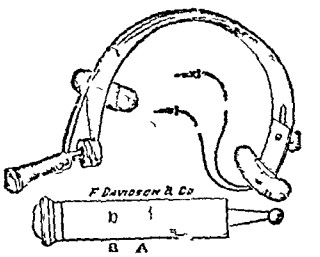
24/5/35 My last battery was dated Sept 1935 and is not yet quite finished — MRCS LRCP

No 585A With Torch Battery in Handle £2 15 0

Prices include spare bulb

The lamp is protected by a glass window so that the speculum can be cleaned when in position

The "DAVON" Self Illuminated SIM'S-FERGUSSON'S STERILIZABLE VAGINAL SPECULUM



Price complete £2 10 0

Can be supplied with obdurator for the Fergusson portion at an additional cost of 12s 6d

I have found all your instruments most reliable and satisfactory — LRCP LRCS LM

Davon Dry Battery 7s 6d

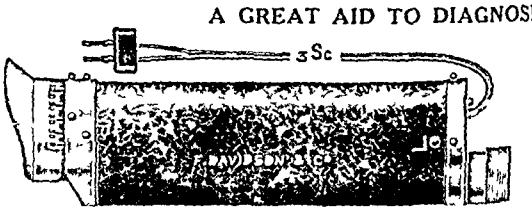
"The present Davon Battery bears the date 3/38 and is only just giving up the ghost after much use" — MD

The "DAVON" AURAL HEAD LAMP

Price with extra bulb £3 3 0

'Davon' Dry Battery 7s 6d

A special condensing system and 4-volt gas filled lamp project a circle of light about 3in in diameter at a distance of 12in **without showing any image of the filament** The light being concentrated at the end of the speculum there is no confusing light outside The lamp can also be used with a laryngeal mirror By withdrawing small cap at 'B' a 1½in **circle** is obtainable for general purposes It is mounted on an adjustable duralumin head band with sorbo pads, and is very comfortable to wear



I am glad to say that the head lamps are giving good service and are more satisfactory than any I have previously used — LRCS

It is the finest head lamp that I have ever used and I always carry it as part of my kit to outlying farmhouses' — MRCS LRCP

'I am very pleased with it' — MD LRCS

"DAVON" DIRECT VISION OPHTHALMOSCOPE

A GREAT AID TO DIAGNOSIS

Gives a clear magnified image of the fundus *without* corneal reflex in bright light, without dilatation of the pupil and at an approximate distance of 7in from the patient Price complete in leather wallet and spare 4-volt bulb £5 0 0

I am delighted with your ophthalmoscope and stethoscope — MRCS LRCP

The "DAVON" ALL-METAL STETHOSCOPE

With Phonendoscope in Wallet with Zipp Fastener £1 6 0

With Bowles Chest Piece in Wallet with Zipp Fastener £1 8 6

With both Chest Pieces (interchangeable) in Wallet with Zipp Fastener £1 14 0

SKINNER'S CHEST PIECE CAN BE SUPPLIED IN PLACE OF PHONENDOSCOPE AT SAME COST

'It is easily the best stethoscope I have ever had' — MD

It is magnificent in trument and better than any I have hitherto handled — Med Superintendent

"THE PNEUMETTE" *(Patented and British)*

THE ONLY FOOT ARCH SUPPORT WITH AN AIR CUSHION

'I have prescribed Pneumettes for several of my patients with remarkably good result in every case — MD

PAMPHLET on FOOT TROUBLES with Article The Medical Aspects of Flat Foot by an eminent London Physician free

Every home should have—

ELECTRIC
HOT WATER

Most medical practitioners have, at some time or another, needed hot water in time of emergency in a patient's home and have had to wait for a kettle to boil in order to get it Today constant hot water by electricity is within the reach of patients both rich and poor A simple immersion heater in the existing water tank ensures instant hot water day and night An electric kettle or milk boiler is also valuable in times of illness and both may be used in the sick room as electric heat is absolutely free from fumes and dirt Far too many patients have still not realised what an efficient and inexpensive hot water service electricity offers them

For useful information, send for the special booklet to the British Electrical Development Association, 2 Savoy Hill, London W C 2 or consult your local Electricity Authority

The Hearing Aid Par Excellence

BŌNOCHORD P.3

Vest Pocket Valve Amplifier

SMALL AS A MICROTELEPHONE YET WITH THE HIGHEST OUTPUT EVER OBTAINED FROM A POCKET VALVE DEAF AID

Since their introduction the main obstacle to the general use of valve amplified deaf aids has been their bulk and weight Attempts have been made to produce them in a form suitable for wear on the person without inconvenience but in every case performance has been sacrificed to size or the instrument has been ungainly for pocket use

The BONOCHORD P3 is a 3 valve amplifier with piezo electric microphone which will fit *easily* into a waistcoat pocket with separate batteries Special valves designed for us have made this possible together with the use of small components developed by our Research Department In spite of its small size the aid has the amazingly high maximum output of 60 decibels Let us send you full details of this new instrument which we believe will do much to establish the general use of valve aids

The Constipation of Childhood

THE treatment of constipation in infancy and childhood calls for special care The young and often delicate organism cannot with impunity be subjected to the drastic effects of many depuratives Often too there is an associated defective assimilation which also requires the consideration of the physician

Cristolax" admirably meets the need for a gentle corrective It is perfectly harmless and free from the possibility of habit formation This efficient lubricant is composed of 'Wander' Dry Malt Extract with which is incorporated 50 per cent of pure medicinal liquid paraffin of correct viscosity

On account of its pleasant flavour easy administration, and its gentle yet efficient laxative action, "Cristolax" is the agent of choice for infants and children Its soothing effect on inflamed mucosa permits its use in infantile diarrhoea, colitis, and other irritated conditions of the bowel

B.D.H. VACCINES

A course of treatment with B D H Vaccines comprises in many instances a series of four or more injections totalling approximately 3 c c It is a measure of economy, therefore, to employ the special B D H rubber-capped vials (containing approximately 3 3 c c) from which this series of doses can be withdrawn as required

The rubber-capped vial possesses a further advantage, the rubber-cap being itself protected by a metal dust cap the replacement of which after each dose has been withdrawn reduces the risk of contamination to a minimum

In cases in which ampoules of 1 c c are required these also are available B D H Vaccines are supplied also in the specially-designed rubber-capped vials of 10 c c and 25 c c respectively

A specimen 3 c c vial containing any one of the B D H Vaccines will be sent on request

ÆTHER PURISS. B.D.H.

Æther Puriss B D H is the purest form of ethyl ether available, it is entirely free from aldehydes and peroxides Every batch is subjected to an elaborate process of chemical purification and subsequently is submitted to the most delicate analytical tests for impurities, its absolute purity thus having been established, it is transferred to amber-coloured bottles, this transference being carried out in an inert atmosphere

The bottles are then sealed securely and, finally, they are wrapped in light-proof paper in order to eliminate all possibility of oxidation during storage

OVALTINE

AN AID TO HEALTHY DEVELOPMENT

MODERN medical research makes it increasingly clear that abnormalities of form mental defects and even permanent constitutional weakness are often a direct result of failure to obtain in infancy a diet adequate to the physiological needs of the organism The basic necessity therefore in constructing the dietary of the infant and growing child is to ensure one that is complete in all the essential food elements

Ovaltine finds one of its most valuable applications in this direction Composed of the nutritive constituents of fresh full-cream milk eggs and malt in well balanced proportions it supplies calcium phosphorus vitamins and other accessory food factors and its regular addition to the ordinary diet of the child renders this safe and adequate

Ovaltine' is so delicious and easily digested that it can be prescribed with complete confidence for children of all ages Ovaltine is easily prepared and is most economical

CASCARA Sagrada was introduced to the medical profession in 1877 by Parke, Davis & Co and Fluid Extract Cascara (P. D & Co) was brought to the attention of the British Medical Association at the meeting in Cork in 1879

Shortly afterwards a process for the preparation of a palatable extract of cascara was perfected in the Parke-Davis Research Laboratories Further experience resulted in the production of CASCARA EVACUANT which is to-day the most active, palatable preparation of cascara available

Cascara Evacuant represents the results of over sixty years' experience in the manufacture of cascara preparations by the firm which first offered cascara for clinical use

It is not fortified with other laxative agents, such as aloes, rhubarb, podophyllum or senna but presents the unique therapeutic advantages of cascara sagrada without its unpleasant bitter taste

CRUNCHY FOODS AND THE DIGESTION

It is generally recognised by dieticians that hard foods are more easily digested than soft ones The explanation commonly advanced is that soft foods are often swallowed in insufficiently chewed masses, whereas hard foods cannot be swallowed until they are properly broken up by the teeth, and in consequence the digestive juices have a larger surface area to work upon and their action is more effective

Many physicians therefore recommend that the normal diet should contain a fair proportion of hard, dry food They find that Ryvita, eaten regularly with meals, supplies a valuable factor in which the modern diet is otherwise deficient Free samples of Ryvita for distribution to patients will gladly be supplied on request

INDICATIONS FOR 'SANATOGEN' No 7

ARTERIO-SCLEROSIS and HYPERTENSION

"Room for Scepticism"

There is room for scepticism as to the causative relation between the stress and rush of modern life and high blood-pressure

Examination of mummies has shown that arterio sclerosis was common even in ancient Egypt, and it was recently pointed out in a medical journal that " the active goat and the horse have little arterio-sclerosis, while the placid cow and the phlegmatic duck are especially susceptible'

That food-intake is important both in the prevention and in the treatment of hypertension is however, generally agreed Purins, toxins and excessive food residues in the colon are all to be suspected and avoided

In the dietetic treatment of high blood-pressure, 'Sanatogen', a carbohydrate free product of 95 per cent pure milk casein *with* 5 per cent sodium glycerophosphate, has been found of great service Its nutritive value is high

BLOOD PRESSURE

I have been very interested in the effects produced by Sanatogen in a case of high blood pressure The patient a young woman was put on a restricted diet for high blood pressure and used to find that in the middle of the morning and after putting her little boy to bed she had a feeling of extreme weakness and was often forced to sit or lie down for some time before she could do anything else She started taking Sanatogen twice a day and after a short period noticed that this feeling was not making its appearance and she has never had it again as she is still continuing with the Sanatogen She is also very much improved in health and seems to have much more reserve energy now The only alteration in diet has been the addition of Sanatogen

—*M B Ch.B*

The Lister Institute OF PREVENTIVE MEDICINE

Therapeutic Substances Act, Licence No 9

Anti-typhoid-paratyphoid Vaccine (T.A.B.)

It is nowadays customary to combine in one vaccine the protective agents against typhoid and paratyphoid A and B fevers, which are all liable to occur in similar circumstances. T A B vaccine contains 1 000 million *B typhosus* and 500 million each of *B para typhosus* A and B per cubic centimetre. Inoculation with this vaccine is strongly recommended for nursing staffs in fever hospitals and persons proceeding to infected areas anywhere (*e g*, on holidays in many Continental countries), or to the tropics. Double inoculation (1 c c followed by 1 c c 7 to 10 days later) produces an immunity regarded as lasting about 12 months at the end of which a further dose of 1 c c is advisible to maintain the immunity.

VOTIVE OFFERING FROM THE REGION OF THE AEDUI IN GAUL PROVIDING EVIDENCE OF THE CELTS RESORT TO HEALING WATERS —The Romans on arriving in Gaul found the Celts devoted to the worship of waters Traces still remain of their bathing stations where in one case the water of a spring was so carefully captured that not a drop was lost The sockets to which images of the healing deities were fixed still exist Large numbers of votive offerings have survived left in supplication or gratitude These sometimes took the form of the diseased member The one here reproduced represents a swaddled infant with an expression of suffering which may be intentional or due to the lack of skill of the sculptor

DATE The votive offering A D c 100

COPYRIGHT

no psychology he is bound to seize on this and treat it, sometimes with success sometimes without Even if successful immediately he may have harmed the patient for the future by letting him think that an unimportant lesion like the one discovered could have caused so much ill-health with its devastating corollary that one cannot take too much care of very small departures from the normal On the other hand after exhaustive inquiries—exhaustive especially to the patient's purse—he may be able to assure himself that there is nothing wrong physically He will now hopefully and enthusiastically impart the glad news to the patient, but not add anything to this purely negative thing which really conveys nothing in the way of information and he is apt to be disappointed when the patient continues to be as ill as before as loud in his complaints His disappointment will probably deepen into annoyance when he hears some months later that this ingrate has been cured by an osteopath or a nature-curer or by any other of the unqualified people who take the opportunity once more to score over medical science not realizing the vitreous nature of the houses they themselves inhabit Our doctor may even become bitter enough to think that this irregular cure was spontaneous There are of course spontaneous cures, but the doctor is more apt to think it for these than he does for his own

It is fairly obvious why a purely negative diagnosis, a diagnosis that there is nothing wrong, is unlikely to help a patient He feels ill and to be told that these symptoms mean nothing is to infer that he is imagining them, and he knows that he is not He is therefore driven to suppose that the doctor has not understood the case If the doctor has been careless the patient can, of course, transfer to another but if the doctor has been careful it may be that the only change open to him is to change the system to go to someone who is not a doctor and who openly preaches that doctors know very little Such a one will not make the psychological error of saying that there is nothing wrong He will find poisoned blood, or pressure on nerves and circulation or faulty posture and by his certainty will inspire the patient with hope, for the time being at least That the immediate good results obtained by these people are genuine I have little doubt that their remote results can be good I have the gravest doubts I am certain that their good results are due to the psychological factors of faith and hope but faith and hope are not of themselves enough for lasting cure I am of opinion that one of the reasons why quacks flourish is that they are better psychologists than most doctors That is not the whole reason which would take too long to go into but it is an important one These patients have something wrong but it is not physical it is something of the nature of mental disharmony Most physicians will agree but they do not teach their students how to investigate this matter as they would teach them how to investigate a cardiac irregularity

There is however another and fundamental reason for the futility of regarding the neuroses negatively When we come to examine these patients from a mental aspect—that is to say when we take their histories—we find that their symptoms are the positive responses to anxieties conflicts and the like of exactly the same order as symptoms may be the positive responses to physical stimuli We have as a profession learned much of the action of physical irritants we must now turn our attention to symptoms produced by mental irritants We shall then find that there is nothing negative about the neuroses any more than there is in physically determined illnesses

In every case of illness there are three questions to be answered Are these symptoms due to physical irritants, to mental irritants or to both? No diagnosis is nearly complete till they have been answered

The "Fancy" Diagnosis

So much for the conscientious doctor who, when this sort of thing happens often enough may become less so One not very good at the beginning, finding nothing that he had been taught to look for, may make a fancy diagnosis on no particular kind of evidence—a weak heart or, more fashionably just now, a gastritis His treatment may be followed again by immediate success neither he nor his patient has the faintest inkling that this may be due to the mental healing factors of faith and hope Even if he succeeds in his treatment he has damaged both himself and his patient—himself because he has started on that downward path which leads to the belief that accuracy of diagnosis does not matter so long as the patient is told something definite it is good if the diagnosis is correct but not dreadfully bad if it is not He has damaged the patient, who has been told that some organ of his perfectly healthy body is not quite healthy and who must now believe that he ought to take care of it and whosoever starts taking care of a healthy body will soon have plenty of illness

There is another unpleasant thought about all this In all these ways doctors are regularly adding to the quantity of neurosis in the world instead of diminishing it They do so if they succeed in the way just mentioned They do so if they fail because the patient soon loses faith in his doctor, gets bewildered and is driven deeper into neurosis I have said that neurosis is common and I must add that it is lamentably common from this cause A patient has symptoms caused by anxiety The doctor says it is due to some physical lesion The patient becomes anxious about this The anxiety causes more symptoms and this helps to fix the belief in physical disease, and so on *ad infinitum*

So much for pure neurotics But in addition to them many sick people will add mentally determined symptoms on top of a physically determined one Anxiety from many sources is apt to complicate illness, especially chronic illness And in many instances of organic disease the only treatment we shall be able to give will be psychological

Teaching the Next Generation

I should like now to leave my young doctors and get back to the wards and try to plan how the next generation is to escape the mess that these poor young men are in At once the questions arise Where are these students to be taught by whom, and what are they to be taught?

The answer to the first two will probably be that that is arranged for already—namely, in the psychiatric department by the psychiatrist And my reply is that it is not good enough, for many reasons, some of which have been given The question of neurosis must be raised often all over the hospital The student must continually be made clinically aware of its possibilities as regards symptoms, and every teacher ought to be able to say something about the elements or principles of treatment Now what is to be taught?

A physician of my acquaintance told me that it was high time we psychological people put our house in order, and I would respectfully ask those of our medical friends who acknowledge that we have a case to help us to present it properly, as they have done with other

technicians like surgeons and bacteriologists They do not give these people a free hand with their patients but call them in consult with them and then use them or not as seems fit

There is an idea abroad that no psychological treatment except psychoanalysis is worth talking about I have spent my life in trying to show that this is not true I am saying nothing against psychoanalysis which is probably the best treatment for certain cases but there are a great number of patients who do not need it for whom something quite simple is all that is required I have no wish that medical students should learn analysis It would be impossible for them to do so even if it were desirable Time would make it so For the same reason even if psychoanalysis were the only psychotherapy mental treatment would be impossible for the majority of patients In my view there are and have been for a long time simpler and shorter methods of psychotherapy which are at least as old as Freud's system and of which the greatest exponent was Dejerine of Paris This depends on the fact that many symptoms are caused by conflicts and anxieties which are not necessarily unconscious in the Freudian sense but which are not being faced properly Taking a full history in the course of which the patient may be induced to speak of these worries be guided about them have many of them explained so that they no longer cause anxiety will in many instances bring about a great change for the better in the patient's mental outlook and in his health Many of these anxieties will be on intimate personal matters and talking about them will often give relief Many will be about disease and health It is incredible what extraordinary views people hold about health in general and their own in particular and here it is that doctors should be more careful than some of them are in telling patients that they may have frail or impaired organs when the real truth is that these doctors themselves are unable to make a diagnosis For the same reason students should be taught when there is physical disease not to put the gloomiest possible view before the patient a thing done often with the best intentions so as to bring a patient to take some care of himself but which may be followed by disaster

There is one essential—namely that the patient and the investigator *must be alone together for their talks* People will not speak of intimate things before a crowd Therefore it cannot be demonstrated to students how to do it but students could be told the procedure and be supervised while they were learning to practise on patients There will be cases which such a procedure will not cure these are for the specialist We expect a general practitioner to treat many dyspepsias kidney diseases headaches and catarrhs by himself *and not to run to a* specialist for every one But there will be dyspepsias headaches and catarrhs for which he will need a specialist and we expect him to learn which are those that he can treat himself and which are those where he should seek special skill The same thing applies to the neuroses

The Teachers

Who is going to teach the students? Time is needed There should be someone who can teach them as clinical tutors teach them physical signs These teachers may be under the psychiatrist, but whoever is at the head of this department should not be locked away in the department of psychiatry *but should be asked to come to the* wards and consult with the physicians and surgeons as to whether there is a large emotional element in this case or not The medical or surgical chief and the student will then not lose sight of the case as they will if the patient is dismissed to the psychiatric department because the general ward has got tired of him It I am told this is impracticable I answer that nothing is impracticable which has been done and is done Dejerine did it in his wards and said that he got better results than in private practice It is being done in America and an extremely vivid description of the psychiatrist being welcomed in the general wards and consulted frequently has been given by J Kasanin of Chicago (1937)

THE VALUE OF RADIOLOGY IN THE ELUCIDATION OF HAEMOPTYSIS*

BY

FRANKLIN G WOOD, M B, D M R E

Radiologist to the London Chest Hospital Victoria Park and to the German Hospital Dalston

Haemoptysis is an important symptom in diseases of the chest and was formerly considered to be a certain indication of pulmonary tuberculosis unless the contrary could be proved We know now that it may be a symptom of *any chronic or acute disease from simple bronchitis to* lobar pneumonia

Haemoptysis in Pulmonary Tuberculosis

If pulmonary tuberculosis has been responsible for a haemorrhage from the lungs a chest skiagram will nearly always supply evidence of this disease But it sometimes happens that although the history and symptoms are suggestive of pulmonary tuberculosis a skiagram fails to show any abnormality It appears probable that this may be explained by the presence of a small focus of disease which either proves abortive or goes on subsequently to the development of a more obvious lesion It is desirable however, that a very careful radiological examination should be carried out since a tuberculous focus or even a small cavity posterior to the lung root or heart or behind the domes of the diaphragm may be easily missed The investigation should include a screen examination and radiographs taken in the oblique and lateral positions The semi oblique position with the patient rotated so that the clavicle on the side to be examined is parallel with the cassette is of special importance in demonstrating lesions in the vicinity of the lung root Radiographs taken with the Potter Bucky diaphragm or a fixed grid of the Siemens or Lysholm type are also of value especially in stout patients

The invention of tomography has considerably enlarged the scope of the radiological examination of the chest and I think that in the future it will prove a method of considerable interest in the examination of cases of haemoptysis with no obvious lesion in the lungs As some of these patients subsequently develop a lesion which can be demonstrated radiologically it is important to carry out serial radiographs at intervals to exclude the presence of disease

There are many other conditions besides pulmonary tuberculosis which may cause haemoptysis the most

* Read in opening a discussion in the Section of Radiology at the Annual Meeting of the British Medical Association Plymouth 1938

important being bronchiectasis heart disease new growth, aneurysm and trauma A frank haemoptysis may also occur in early pneumonia An interesting paper was published in 1928 by Vinson describing work carried out at the Mayo Clinic on the relative frequency of haemoptysis in pulmonary tuberculosis, bronchiectasis, and mitral stenosis The history of 100 patients suffering from each of these diseases was contrasted, and it was found that forty nine of the 100 with bronchiectasis had haemoptysis as compared with twenty-nine in the pulmonary tuberculosis group and only eighteen among those suffering from mitral stenosis This suggests that while it is true that pulmonary tuberculosis usually is the cause of a pulmonary haemorrhage because of the greater frequency of the disease the relative incidence is much higher in bronchiectasis

Dry Haemorrhagic Bronchiectasis

The occurrence of haemoptysis in bronchiectasis has been known for a long time but it is only since the introduction of lipiodol as a method of outlining the bronchi that the presence of what is termed 'dry haemorrhagic bronchiectasis has been successfully demonstrated In this condition there are no obvious physical signs such as clubbing of the fingers or purulent sputum, which may reveal the presence of the disease on clinical examination The radiological investigation is therefore of considerable importance The preliminary radiographs may show evidence of fibrosis or the dilated bronchi may actually be visible as a series of spherical or cylindrical clear spaces, but in any case lipiodol will be required in order to show the extent of the disease The lesion may be found either in the upper part of the lung, where it closely simulates pulmonary tuberculosis in appearance, or, more commonly in the lower zone where it is less likely to be confused with other lesions When the condition is developmental in origin and probably due to failure in budding the dilatations are spherical in appearance, while in the acquired disease the dilatations are usually cylindrical

There are many methods of introducing the oil in common use the simplest of which is to drop it on the back of the tongue after abolishing the swallowing and cough reflexes by means of a 5 per cent cocaine spray and 10 per cent brush in each case a little adrenaline being added This gives good pictures when successful, and causes the patient a minimum of discomfort The use of a nasal catheter is a surer way which enables the oil to be injected into any part of the lung under screen control The lipiodol can also be introduced through the crico thyroid membrane

If the opaque medium is introduced through a bronchoscope the resulting films are never so good as those obtained by other methods The lipiodol tends to be concentrated in one part of the lung and the appearances are often deceptive owing to localized areas of alveolar filling which may closely resemble cavitation in the lung It is however often impossible to outline properly the cavity of an abscess of the lung by any other method

The radiographic technique will naturally vary with the apparatus at the disposal of the operator It is essential to take radiographs in the shortest possible time and to over expose the films It follows from this that a set of high output and the use of a rotating anode tube will give the best results The exposure time should if possible be one-tenth of a second or less

Haemoptysis in Heart Disease

The radiological examination of the heart is an important branch of chest radiology that has made very much progress in recent years The appearances of the heart and great vessels on screen examination and in the teleradiograph have been exhaustively studied, and more recently kymography has been introduced as a method of examination which is already proving of considerable use The apparatus consists of a moving grid with a series of horizontal slits at intervals of twelve millimetres which record the movements of the beating heart as a wavy line Respiratory movements of the ribs and diaphragm can also be registered In the examination of the heart the exposure is made with the breath held so as to avoid respiratory disturbance of the heart movements Each region of the heart has a characteristic curve The aortic arch also gives a wave form which distinguishes it from opacities due to neighbouring structures

It is necessary to exclude any lesion of the heart when examining a patient with haemoptysis, since many of these patients are in reality suffering from heart disease Haemoptysis is less common in heart lesions than in pulmonary tuberculosis or bronchiectasis, but it is an important symptom in mitral stenosis Paroxysmal attacks of haemorrhage may occur in this disease, due to congestion in the lungs or to infarction In an early case of mitral stenosis the first radiological sign in an anterior radiograph is a prominence of the pulmonary artery and pulmonary conus Some enlargement of the left auricle may probably be detected at this stage in an oblique film As the degree of stenosis increases there is a progressive enlargement of the left auricle, which can be seen bulging into the retrocardiac space both on screen examination and in radiographs taken in the first oblique and lateral positions with or without a barium swallow The accompanying congestion in the lung fields is a characteristic feature

Pulmonary Infarction

Pulmonary infarction is a possible cause of haemorrhage wherever there is vascular engorgement in the lungs Such engorgement may occur in mitral stenosis and also where there is left ventricular failure It also occurs as a post-operative phenomenon The radiological changes seen in pulmonary infarction were not well known before the advent of the portable radiograph As the patients are usually very ill the condition is rarely seen in the routine radiographs taken in the x-ray department Shirley Smith (1938) in a recent paper has described thirteen cases with radiographic control The changes are usually seen at the base of the right lung The appearances are variable and may consist of an area of clouding rather like the appearances seen in pneumonitis, or an irregular shadow may be present resembling that seen in lung abscess An accompanying pleural effusion may mask the area of consolidation in the lung It is worthy of note that in the absence of pleural effusion the heart is usually drawn slightly towards the side of the lesion

Bronchial Carcinoma

A frank haemoptysis is uncommon in bronchial carcinoma although it may be a leading symptom for instance in a malignant papilloma spreading from the bronchial wall The lumen of the bronchus at the site of growth may be filled with necrotic material, and blood is not present in sufficient quantities to be obvious in the sputum In the relatively rare benign bronchial growths, such as papilloma and endothelioma, haemorrhage is on the oth

hand common and may be profuse A bronchial carcinoma usually produces changes in the lungs that are easily seen in a film, but the small benign growth will not be detected unless it is large enough to block the lumen and cause atelectasis It follows therefore that the radiological examination may be entirely negative Examples of such cases were described by Morlock and Scott Pinchin (1935) McGibbon and Baker Bates (1937) and others The latter authors describe tracheal varix and non specific granuloma as causes of pulmonary haemorrhage The rare tracheal carcinoma may be the cause of haemoptysis and is sometimes visible in the skiagram after lipiodol If the radiological examination is negative and the attacks of haemoptysis continue a bronchoscopic examination must be considered

Aneurysm of the Aorta

In aneurysm of the aorta haemoptysis is only seen as a terminal event staining of the sputum being a warning sign of the imminence of a rupture The diagnosis of aneurysm is not always easy to the clinician especially if the posterior part of the arch or the descending thoracic aorta is involved Unfortunately it is not always simple for the radiologist, for any growth or tumour in the neighbourhood of the aorta will simulate an aneurysm especially if the growth is one in close contact with the aortic arch and involving the pericardium Mistakes often occur and the Wassermann reaction is not an infallible test Aneurysm may simulate a dermoid cyst if it is directed forwards and laterally in the superior mediastinum Kymography is of great assistance in such cases and I think that in the future it should lead to a correct diagnosis in most cases since it enables us to separate the outline of the aorta from the growth and usually gives a characteristic picture

Haemoptysis following Injury to Chest

Haemoptysis may follow injuries to the chest with or without rib fracture Where the injury is severe the presence of a fracture is very easily shown, but there are many cases where radiological demonstration of a fractured rib is difficult A general radiograph of the chest sometimes fails to reveal the injury A localized view may be of assistance This can be done by two methods The cassette is placed in contact with the site of greatest pain and compression applied so as to prevent movement of this part of the chest wall If the patient is then instructed to breathe lightly the part of the ribs in contact with the cassette will remain stationary and the outline of the remainder of the ribs will be blurred owing to the movement The second method is to diminish the focal skin distance so as to blur the overlying ribs and bring the part of the chest nearest the cassette into focus

Conclusion

This summary of the main conditions which may be the cause of a haemoptysis cannot be considered to be complete but I hope it will have served to show that a radiological examination is an essential part of the investigation of these cases and that it may be a deciding factor in the diagnosis It is well known that no examination of the chest is complete to day without a complementary radiological investigation

PLAY-THERAPY FOR "PROBLEM" CHILDREN

BY

ETHEL DUKES, L R C P & S
Medical Director Institute of Child Psychology

The object of this paper is to show the immediate results of treatment and the present condition of the children who attended the Institute of Child Psychology for varying periods between the years 1930 and 1935 With the exception of four cases all the children included in the follow up were treated by the psychological method known as play therapy according to the technique devised by Dr Margaret Lowenfeld who started the institute as a small clinic for problem children in 1928

During the period under survey 247 children were accepted as patients Of these thirty two were consultation cases in which the children attended not more than three times and in which periodical advice as to management was all the treatment indicated and given Although we know that some of these cases are doing well they have not been included in the chart as they were not treated by play therapy Fourteen patients were discovered to be mentally defective and were rejected twenty three cases were immediately transferred to other institutions for various reasons and in twenty four cases the parents proved uncooperative soon after acceptance and the patients ceased to attend The remaining cases 154 in number received full treatment and are analysed in the chart below The eldest child was 17 and the youngest 2½ They are divided into four categories—namely neurosis anti social and behaviour problems physical complaints and educational difficulties

The majority of the children were recommended by school authorities social agencies police-court officials hospital doctors and private practitioners The remainder were brought by patients or friends

Neurosis (76 Cases)

Under this heading are included cases in which the chief causes for reference were the following anxiety night terrors sleep walking excessive or unwarranted fears and inhibitions nervousness and hypersensitiveness hysteria tics and habit spasms lack of concentration or self-confidence inability to play screaming fits anorexia nervosa insomnia and obsessions In addition to one or more of these symptoms seven suffered from enuresis nine from speech defect and fourteen were backward at school

TREATMENT

Twenty-seven were treated by play therapy alone In addition to play therapy forty two had some kind of medical surgical or dental treatment for physical disorders discovered on examination ranging from dental caries to undescended testicles nine had speech therapy and fourteen educational coaching in one or more subjects Some children needed two or three of these types of treatment

Anti-social and Behaviour Problems (38 Cases)

These children were referred to the institute on account of difficulties such as excessive disobedience temper tantrums unmanageableness truancy vagrancy lying pilfering stealing excessive bullying sexual offences destructiveness gangsterism etc In addition seven of

the above suffered from enuresis and five were backward at school

TREATMENT

Eighteen were treated by play therapy alone In addition to play therapy eighteen had treatment for physical disorders and five had educational coaching

Physical Complaints (34 Cases)

These children were referred to the institute on account of some chronic medical disorder for which, in many cases previous treatment had been of no avail The complaints included asthma eczema, urticaria fits functional eye complaints functional paralysis muscular incoordination general debility pyknolepsy, colitis vomiting etc In some cases there was an underlying neurosis which manifested itself only in this manner or there was an accompanying neurosis which helped to form a vicious circle Eighteen had enuresis either as the only complaint or in addition to another

TREATMENT

Sixteen were treated by play-therapy alone In addition to play therapy seventeen had some kind of dental medical or surgical treatment and three had educational coaching

Home Circumstances

Comprehensive accounts of the home conditions of these children have been obtained, and are graded according to three evaluations good unsatisfactory, and bad

Good—In these homes the material conditions were good varying only according to the social position of the family So far as could be ascertained the emotional relations between the parents were normal Any psychological mistakes in the nurture of the children were such as spring from a too strong insistence on the ordinary taboos and inhibitions prescribed by convention and a sense of respectability and a too early or rigid training in cleanliness and social behaviour Symptoms of anxiety neurosis were noticeable in some of the mothers

Unsatisfactory—In these homes, though the income was usually sufficient for the needs of the family unless there was temporary unemployment, the psychological conditions were not good Parental psychoneurosis bad relations between the parents, broken homes bad management of the home adoption and illegitimacy, and gross mismanagement of the children were among the difficult factors in the family situation A few of these children were now living in homes and hostels having had bad earlier experiences

Bad—Here the conditions were bad in every sense Poverty, overcrowding slum conditions drunkenness sexual offences illegitimacy, feebleminddedness wife beating, and desertion were prevalent

The figures show that in the neurosis, the anti-social and the medical groups (the educational group is too small for comparison) there is a correlation between the type of home the complaint and the average intelligence quotient The average intelligence quotient was lower in the bad type of home in all three groups

In the anti-social group the numbers admitted for anti-social behaviour vary directly with the type of home being smallest in the 'good' type From the bad type of home came 52·6 per cent of the anti-social cases from the unsatisfactory type 34·2 per cent from the good type only 13·2 per cent

In the neurosis group the figures were 21 per cent from the bad type of home 47 3 per cent from the unsatisfactory type and 31 5 per cent from the good type Neustatter (1938) showed that poor social conditions did not necessarily produce neurosis in children unless there were symptoms of it in the parents The above figures seem to confirm his findings and to suggest that delinquency and crime are more likely to be the end results in the bad type of home It is interesting to note that the highest percentage of neurosis cases came from the more comfortable homes where psychological conditions were bad

The results of treatment the length of time taken and the number of attendances necessary do not seem to bear any relation to the type of home Just as good and enduring results seem to have come about in cases from bad homes as in those from the other two types This suggests that the direct method of play therapy can be successful in helping the child to overcome his difficulties without the necessary aid of environmental change

Immediate Results of Treatment

Many of those placed under much improved on discharge might have been labelled well —that is free from the symptoms for which they were referred with no development of other symptoms indicating that adjustment had not been reached But as we felt that consolidation was still necessary after they left they were designated in the case sheets much improved

Present Condition of Patients

It is satisfactory to report that many of the much improved cases can now be labelled well and as far as can be judged are completely normal Under the heading unadjusted are four anti social cases one of whom is in Borstal and two are in Home Office schools These cases were prematurely removed from the clinic by their parents who became uncooperative after the children had had a certain amount of treatment They all came from bad homes One case of neurosis from a bad home is now in Borstal The present condition of the 154 patients is as follows

Well	78
Improved and much improved	36
Unadjusted	12
Dead or not traced	18
Transferred to other institutions	10
	154

This is not a large number but the method of treatment was then new and experimental and fewer cases were taken than now At the Institute of Child Psychology attention is more intensively concentrated on the treatment of the patient and less on the alteration of environmental conditions and consequently the period of treatment is longer and the attendances more frequent than in other clinics treating similar cases by different methods The social worker does not visit the home more than once and the aim of the treatment is to help the child to overcome his own problems rather than to remove difficulties from his path On the other hand the constant attendance of the mothers at the centre and the influences exerted upon them both in the social workers department and in the parents department doubtless have an effect through the mother upon the home environment

The clinic is open twice weekly for sessions of two hours each and the majority of the children attend twice a week until improvement is well established when the intervals are extended until attendance ceases altogether except for reporting purposes Every child receives a medical examination on entrance and at periodic intervals Where necessary medical or surgical treatment is arranged for in consultation with the family physician if there is one in order to help the child to become as physically fit as possible Simple medical treatment is given at the institute itself if the parents are too poor to pay for private medical attendance In some cases convalescent holidays are arranged for varying periods In certain medical disorders however where a psychological origin is suspected no medical treatment at all is advised or given As an adjunct to play therapy and also in the interests of physical fitness the physical re education and rhythm department is of great help in treatment The formation of a parents department in charge of a medical psychotherapist though primarily for the purpose of helping the parents with their own difficulties is doubtless responsible for the fact that once the child's treatment is established a large percentage of the mothers remain co operative throughout however long it takes

Acknowledgments are due to Dr Elspeth Macleod tutor Institute of Child Psychology for the help she has given with some of the cases

TREATMENT OF GONORRHOEA WITH ULERON

BY

D F WALSH, M B , B Ch

Surgeon Lieutenant Commander R N

The following is a record with observations of forty-three cases of gonorrhoea of which twenty one had received routine treatment for at least six weeks prior to having uleron

Uleron is one of the newer compounds evolved in the endeavour to obtain a drug possessing the lowest possible toxicity which would influence the largest number of bacterial diseases apart from streptococcal infections It has the formula

It is one of three closely allied compounds which only differ by substitutions in the final sulphonamide group and which have been found to exert a more favourable influence in gonococcal infections than any of the other thousand compounds investigated

Uleron is manufactured by Messrs Bayer who kindly put a supply at my disposal I was told quite frankly that they could make no definite claims for uleron which was still under trial that I might find it a complete failure and that neither its dosage nor its non toxicity was established It had been tried out in some clinics in Germany and a translation of the report by Grutz, New Foundations for the Treatment of Gonorrhoea an advance proof of Fischer's New Methods of Treatment of Gonorrhoea and Felke's On the Chemotherapy of Gonorrhoea constituted the available literature at that time These three workers were most enthusiastic about the therapeutic value of the new compounds They claimed their advent as the greatest advance ever made

in the treatment of gonorrhoea and were confident that the long awaited solution to the problem of a speedy cure for that disease had at length been found

Earlier Experiences with Uleron

Grutz had worked mostly with one of the other compounds of the uleron group, which he found superior to uleron though in his tables only two cases seem to have been treated by uleron alone In his series of thirty-six cases he obtained twenty four cures The total dosage varied between 6 grammes and 82 grammes Toxic effects were noted in eleven cases

Fischer treated forty cases one half with uleron, the other half with the allied compound used by Grutz He observed no distinction between their relative efficacy It was his impression that with the allied compound it was the clinical symptoms not the microscopical findings, that were more quickly affected He made careful observations of the blood pictures of his cases and noted an almost constant diminution of the polymorphs with a relative increase of the lymphocytes towards the end of a course Apart from this neither preparation gave rise to any evidence of toxicity He further stated that the urinary findings were in no way abnormal and that estimations of bilirubin xanthoprotein blood sugar, and blood calcium invariably showed figures within physiological limits He gave 3 grammes daily for three days and repeated the course in eight to ten days if necessary Later he obtained equally good results with 2 grammes daily for five days Toxic effects were completely absent He found that non-recent cases reacted better than acute ones and for the latter advocated either waiting ten to fourteen days before starting the treatment or stimulating the body defences by vaccines injections of blood olobinthin or colloidal sulphur irradiations etc In his finally published paper he had obtained cures in fifty-five cases out of fifty eight with only one relapse and one case of toxic rash and pyrexia

Felke reported on fifty cases He too stressed what he terms the preparedness of the body for cure and recommended that acute cases should have a short course of uleron to clear up the gross symptoms then an interval for Janet irrigations twice daily during which time the body defences were mobilized and only then a second course of uleron 2 to 2 5 grammes daily for five or six days To one case he had given 61 grammes in three weeks without causing side effects but considered such dosage excessive and to be avoided He hoped for still newer compounds requiring a smaller degree of co-operation on the part of the body Commenting on the mode of action of uleron he noted that even while taking large doses the blood of the patient had no inhibitory action on the growth of gonococcal cultures

Treatment of the Present Series

It was suggested to me that the results of treatment by smaller doses would be of interest A dosage of three tablets a day—1 5 grammes—was adopted and adhered to in all my cases In spite of the results already obtained elsewhere I began treatment cautiously my earlier patients receiving a three-day course which was only repeated after an indefinite interval of observation for relapse delayed cure or toxic manifestations As it became evident that such treatment was insufficient the interval between the courses was shortened Next the courses were lengthened and also the intervals the latter being again shortened as the almost complete absence of toxic symptoms became evident In addition to receiving uleron for the periods shown in the case records all patients were irrigated twice daily with potassium permanganate 1 in 10 000, and had prostatic massage once a week if the prostatic smears were pathological

The standard of cure was not exacting All treatment was stopped Daily examination was made for urethral discharge immediately on rising, as well as of the first morning urine by the two-glass test Other criteria were the anterior urethra normal on urethroscopy, the passage of a large sound, a prostatic smear showing absence of organisms and less than four pus cells per field The minimum observation period was eight days this was extended up to twenty-one days in many cases

Complications—None occurred in any patient after commencement of treatment with uleron

Toxic Effects—One possible case, No 37 gastro enteritis pyrexia, and giant urticarial rash on the eleventh day of treatment The temperature (101 4°) became normal in forty-eight hours, and the rash had gone within seventy-two The patient blamed some tinned salmon for this upset, volunteering the information that on the previous evening he had eaten some for the first time for nine years Nine years ago its ingestion had been followed by severe gastro-enteritis but no rash

Results of Treatment

21 cases had	a three day course	5 were cured
11	second course	2 (6 were cured after 7 to 15 days uleron)
12	four day course	1 was cured
8	second course	4 were cured
3	13 to 17 days treatment	No cures
4	five day course	1 was cured
2	second course	No cures (1 was cured after 11 days uleron)
2	six day course	No cures
4	seven day course	2 were cured
Cured 22 cases (2 acute 20 non acute)		
Failures 21 cases of which 15 were inadequately treated		6 were adequately treated

My results seem to compare unfavourably with those of the German clinics to which I referred earlier The obvious cause for this is under-treatment due to three things the number of cases (seven) transferred from my charge before treatment was completed (Nos 4, 6, 19, 21, 22, 35, 36), overcaution in abandoning treatment (five cases, Nos 5, 9, 12, 16, 26), and lack of uleron to complete treatment in three cases (Nos 38, 39, 40) These fifteen cases are not true failures They are short treatment failures, and should only be assessed as such They are included lest the false impression might be given that a high percentage of cures can be obtained after a few days treatment with uleron I am recording several such cures, but I regard them rather as the exception than as the rule—agreeable surprises when they occur, but not to be expected in any individual case It is rather unfortunate that nine out of these fifteen cases were in the acute stage—that is, in the first three weeks of the infection Of the six true failures it is significant that five were acute cases and that only two of the successes were acute

Clinical Observations

The immediate effects of uleron are remarkable In nearly every case the discharge dwindles rapidly and the urine clarifies within a couple of days The discharge becomes a morning dampness, and gonococci disappear almost abruptly from the urethral smears The usual transitional stage seems to be entirely absent, for no Gram negative extracellular diplococci were reported in any of the slides In only three adequately treated cases did gonococci persist in the urethral discharge Subjective symptoms such as dysuria and painful erections

ceased I had not the opportunity of noting the effect of uleron on acute complications as most of my compli cated cases had got over their acute symptoms when they reached me The extraordinarily rapid clinical improve ment and deceptively clear morning urines give rise to an expectation of speedy cure which is not always fulfilled The morning dampness invariably consists of pus cells and coccal organisms, Gram negative cocci being the most common finding To cause complete cessation of this pathological dampness was the difficulty for it sometimes proved resistant to second and third courses of uleron to periods of irrigations alone and to complete rest from treatment From the patient's point of view the gonorrhoea was cured and it would be easy to over look this slight persistent urethritis if the patient was not under strict observation Cessation of local treatment at this stage invariably led to a gradual increase in the amount of the discharge though gonococci were seldom demonstrated after they had been absent for about ten days

It was tantalizing to arrive almost at a cure so speedily only to be checked by the morning dampness It was felt that some small alteration in the dosage or prolongation of the courses would overcome this final obstacle to cure in many cases and it was this incentive which led me to pass on too quickly to seven day courses when my supply of uleron was running low In spite of some wonderful cures with three-day and four-day courses I felt that even two four day courses of 1 5 grammes per day would not give the best results of which I believe this drug to be capable Thirteen of my patients had more than eight (nine to seventeen) days treatment seven of them being cured four within the ten day limit Nineteen out of my twenty-two cures were obtained with a maximum of ten days treatment which I would cer tainly use as a standard basis for further clinical trials with uleron It is fully realized that one is not entitled to draw conclusions from experiences with a couple of dozen cases and that the adoption of a ten day standard is arbitrary and unproven The method of action of uleron is not fully understood Fischer says We cannot speak of its disinfectant action but rather of one affecting the reticulo endothelial system It is suggested that intermittent is preferable to continuous treatment in which case the dosage of 1 5 grammes per day might be increased with advantage in the absence of toxic symptoms With the smaller dose which I employed I feel that at least two day five day or even seven day courses would give excellent results and this matter deserves full clinical investigation

Impressions from the Treatment

The number of cases I have treated is too small to permit me to draw conclusions I can only record my impressions They are

That uleron is definitely a most valuable adjuvant in the treatment of gonorrhoea

That in the dosage I employed uleron appears to be non toxic

That with moderate doses used in conjunction with local treatment a cure can be obtained in a large number of cases more quickly than hitherto possible

That the non acute cases seem to respond more readily than the acute cases

That when the optimum dosage is established a high percentage of cures should be possible within three weeks

That a small percentage of patients may prove completely resistant to uleron treatment

A POST-MORTEM RECORD OF PULMONARY TUBERCULOSIS IN DIABETICS

BY

S ROODHOUSE GLOYNE, M.D., D.P.H
Pathologist London Chest Hospital E

The belief, based upon clinical observation, that diabetics are especially prone to tuberculosis is of long standing Fishberg (1932), however, was not convinced, and regarded the percentage of diabetics presenting tuberculous lesions at necropsy as not at all formidable Root (1934, 1937) has investigated the point statistically by means of post-mortem records from various published papers in different countries from the years 1888 to 1932 In 1,121 necropsies on diabetics the incidence of active pulmonary tuberculosis was 28 4 per cent, and in 51,705 necropsies on non diabetics 22 9 per cent He interprets these statistics to signify that since "two diseases occur in association with less frequency than either one alone is found in a series of necropsies, it would appear that tuberculosis is about two or three times as frequent at necropsy as would be expected in diabetes Analysing both the morbidity and mortality figures which deal with American hospitals, Root points out that the incidence of pulmonary tuberculosis in adult diabetics is not diminishing, despite the general decrease of tuberculosis mortality, and that this sequel occurs in juvenile diabetics more than ten times as often as among non diabetic grade and high school children in Massachusetts

I am not aware of any recent mortality statistics bearing upon this subject in England and Wales, though Dunlop (1937) has published a clinical record of twenty eight cases in Edinburgh The Registrar-General's report (1937) shows that the mortality from tuberculosis is declining and that from diabetes is rising the total number of deaths in 1936 from tuberculosis being 28,268 and from diabetes 7,119

The Material Investigated

The post-mortem records of the London Chest Hospital, which is primarily concerned with the treatment of intrathoracic disease, show twenty-one deaths (0 75 per cent) from diabetes in 2,826 necropsies (1,138 with active tuberculosis and 1,688 with non tuberculous diseases) between 1888 and 1937 Of the twenty one diabetics four were not associated with tuberculosis and a fifth had only calcareous tubercles with puckering of the lung apices The remaining sixteen had active pulmonary tuberculosis and comprised 1 4 per cent of the 1 138 necropsies with active tuberculosis

Root's collected records of 3 575 fatal cases of diabetes show 5 11 per cent with tuberculosis The twenty one cases of diabetes with a mortality from active pulmonary tuberculosis of 76 19 per cent are too few to be comparable with Root's figures Moreover, a selective influence has obviously been at work in admitting to a chest hospital diabetics with tuberculosis Some information however, may be derived from the details of the necropsies Eleven of them occurred before the introduction of insulin and five after Four of the sixteen cases were of the young adult type—a male aged 27 and a female aged 20 in the pre-insulin period and two males aged 28 and 23 in the insulin period The ages of the other twelve ranged from 40 to 65 and were therefore of the middle-age group Eleven of the patients w

males and five females The type of lesion noted was predominantly caseous frequently with tuberculous pneumonia and all but one had cavities the cavities being multiple in 60 per cent of cases This exception a male aged 20 was the only case showing signs of quiescence He had only a few widely scattered tubercles the size of a large pin head in all lobes which were almost calcareous There were three instances of acute miliary spread two of fatal haemoptysis two of empyema and one of pyopneumothorax Pleural adhesions were noted in all cases except one where there is no record on the point This is interesting in view of the fact that some American observers—for example Perla (1936)—have noted a less frequent occurrence of adhesions in tuberculous diabetics than in tuberculous non diabetics of comparable ages Only one patient was noted as having died in coma The most significant finding of all however was the absence of tuberculosis elsewhere excepting one instance of miliary tuberculosis in the kidney Even tuberculous laryngitis and enteritis which are such common features of the tuberculosis necropsies throughout the records were not found No tuberculosis was noted in the pancreas No instance of amyloid disease was recorded Chronic non tuberculous lesions were apparently not more common than might have been expected in a group of cases of which 75 per cent were middle aged There were two cases of chronic kidney disease two of fibrosis of liver two of atheroma one of renal calculus and one of uterine fibroid No significant differences can be made out in comparing the type of lesion found in the pre insulin and the insulin period

Summary of Data

The data may be summarized as follows

1 The figures recorded are too few and of too selective a character to throw any statistical light on the question whether or not diabetics are more susceptible to tuberculosis than are the general population No figures appear to exist for this country to confirm or refute the clinical impression that the diabetic is a favourable soil for the tubercle bacillus but the extensive American figures on the whole support the view

2 The majority of the patients in the present series were of the middle age group

3 The type of tuberculous lesion found was that of excavation with extensive caseation often pneumonic or bronchopneumonic in distribution The common sequel of tuberculous laryngitis and enteritis was not encountered

4 No tuberculous foci were found elsewhere in the body (including pancreas) except one example of miliary tubercles in the kidney evidently a terminal lesion

5 No instance of amyloid disease was recorded

6 Only one instance occurred in which there was any sign of quiescence

7 No significant differences were noted in the necropsies of the pre insulin and insulin periods

Commentary

Obviously the diabetic is exposed to the same risks of infection as the rest of the population but the salient features which stand out from this record are that (1) when tuberculosis developed in the diabetic it was almost invariably the uncomplicated pulmonary form of the disease and (2) signs of healing of the tuberculous process were rare These points confirm the observation of Perla in a comparable series of necropsies on diabetics and non diabetics with tuberculosis that in the former there was a greater rapidity of development of the tuberculous process The effects of altered metabolism in the diabetic state are however so numerous that it is impossible at the present time to attribute to any one of them alone the blame for providing the favourable soil for the growth of the bacillus Possibly the low respiratory quotient as found in the diabetic animal (Ralli Canzanelli and Rapport 1931) and in certain cases of diabetes in man (Joslin 1937) may be important in this connexion

Clinical Memoranda

Traumatic Rupture (Complete) of External Iliac Artery Amputation Recovery

This case so far as I know is unusual and one might say rare enough to justify publication

CASE RECORD

A quarryman aged 35 while removing a "relief valve" from a Diesel engine which was still running—he standing in direct contact with the valve—was struck in the right groin He was thrown backwards for about four feet and was very badly shocked This took place at about 10.45 a.m. on April 12 1938

Some ten minutes after the accident he was seen by Dr F W A Watt of Tavistock who telephoned to me about 11.15 a.m. The patient being badly shocked we agreed that I should call later in the day thus allowing time for the shock to be treated in hospital I saw him at about 4.30 p.m. the same day His temperature was then subnormal and his pulse which had been taken every half hour was 130 very thin and wiry and of poor volume He was still badly shocked His right leg was useless the toe nails were blanched and there was no pulsation in the posterior tibial popliteal or common femoral arteries This leg was considerably colder than the left There was an enormous swelling which filled up the right Scarpa's triangle and extended into the right iliac fossa It did not pulsate nor was any pulsation felt or heard in either swelling The skin was intact but extensive bruising was present over the lower abdomen not only on the right side but also on the left This bruising also extended up the outer side of the abdomen into the right axilla as well as into the scrotum It was perfectly clear that he had ruptured the right external iliac artery and that he would lose his leg but as there was good reason to think that he had ceased to bleed we decided to still wait until his recovery from the shock

I was kept informed as to his progress from day to day and saw him again on April 15 He then had a pulse of 80 of good volume and regular and as we thought it unlikely that his general condition would improve further we decided to operate the following morning—that is April 16 The condition of the limb on April 15 was about the same there was no pulse in any vessel but on auscultation over the swelling in the right groin transmitted pulsation could be heard By this time he had a distinct line of demarcation in the lower limb This extended from a line about eight inches down from the iliac crest horizontally inwards to a point about three inches below the pubic crest in front, to meet a line which practically took the gluteal fold behind

The skin and limb were warm above these lines but quite cold below with a patchy reddish-blue mottling There was some sensation over the warm area but none below We did not consider it advisable to give him a blood transfusion, as his recovery from the shock had been so satisfactory, and we did not want to raise his blood pressure too much, as this might possibly again bring on bleeding

Operation—With a premedication of morphine and under light gas and oxygen anaesthesia I operated on April 16 I decided to use the extraperitoneal approach, and made my incision as I thought accordingly about three-quarters of an inch above Poupart's ligament but on dividing the skin and deep fascia I came down upon the clot This was rapidly turned out and confined below to the attachment of the deep fascia to that in the outer half of Scarpa's triangle, with Poupart's ligament elevated so that it took a concave shape with the external iliac which was raised from its bed in the ilio psoas and presenting itself under the middle of Poupart's ligament, leaving a space of at least 4 inches between the proximal and distal ends of the vessel The lumen was filled with a firm clot and one could clearly see the torn and twisted intima I placed two floss-silk ligatures round the artery and vein and as the patient's condition justified it I proceeded to do a quick amputation by unequal lateral flaps, cutting just above the line of demarcation described The femur was divided about two inches below the great trochanter, the circulation in the muscles and bone being excellent He stood the operation well and was little the worse when it was finished He has since made an uninterrupted recovery

COMMENTARY

The relief valve ' which caused the injury is of solid steel eight inches in length, the outlet end, which carries a handle, has a diameter of three inches, and the inlet end has a diameter of two and a half inches It weighs 12 lb and was expelled at a pressure of 400 lb to the square inch

The interesting points of this case are

1 The man was in contact with the valve, which must have struck the external iliac vessel at a point on the pelvic brim near where one would normally compress the common femoral vessel, completely dividing it

2 Had he been standing a distance away, other than in direct contact with the valve, the chances of it breaking his pelvis and possibly rupturing his abdominal wall, with grave intraperitoneal injuries to viscera, vessels, etc, would have been considerable

3 The importance of waiting, if possible, in cases of extreme shock could not be better exemplified than in this instance Glucose and saline should be judiciously administered A very close watch must be kept on the pulse, so as to avoid giving an amount that might raise the blood pressure and so bring on haemorrhage

4 It was interesting to note at the end of three days the amount of collateral circulation that had taken place from the internal iliac and ilio lumbar branches, a matter which is so important in cutting the skin flaps

I am greatly indebted to Mr L W Proger to whom I sent the small specimen of the distal end of the vessel for his kindness in looking through the Library of the Royal College of Surgeons for any record of such a case This search proved unproductive but he has kindly sent me a bibliographical list although none of the publications, so far as I know, quite meet the case quoted

Two Compressed Foetuses and Living Baby as an Unusual Cause of Hydramnios

The patient whose case I report had probably started with a triplet pregnancy, including uniovular twins which had died when they were about five months mature, and at that time the hydramnios occurred Owing, I presume, to the fact that there was still one living foetus and placenta, there was still enough of the necessary hormones available to prevent the expulsion of these dead foetuses, the living one growing normally and compressing the dead ones The hydramnios was, I suppose, reabsorbed

CLINICAL RECORD

A multipara, aged 29, with one child aged 4 years, consulted me on October 10, 1937, having had a slight vaginal haemorrhage of a few days duration following two months amenorrhoea the last menstrual period having started on July 10 On examination on October 19 she was not losing, the uterine os was closed, and she appeared to be about three months pregnant

I saw her regularly and the pregnancy progressed quite normally until December 23, 1937 when the uterus suddenly became enlarged to the size of at least a thirty six weeks pregnancy, and the abdomen was so tense that foetal parts could not be felt The patient complained of nothing except a little difficulty in bending, and as she had to go away the next day was not examined by x rays, though I warned her of the possibility of twins or some abnormality, and instructed her to see a doctor at her home if anything untoward occurred

I did not see her again till February 28 1938 when the uterus, though somewhat soft was of normal size for the term of pregnancy, then about thirty weeks, having diminished considerably in size during the interval Foetal parts of one foetus only, could be felt per abdomen, one foetal heart only could be distinguished, and everything appeared to be normal The pregnancy continued apparently normally until *April 6, one month* before the expected date for the baby to be born when the patient started labour spontaneously and was delivered of a living male infant about four weeks premature, and weighing 6½ lb After the delivery of the baby the uterus felt large and hard, but not large enough for the presence of a twin to be suspected After ten minutes a second bag of membranes presented, and with only one further uterine contraction the placenta, together with an unruptured bag of membranes, which contained foetal parts, was expelled On examination this proved to be twin foetuses, surrounded by and embedded in a brown clayey substance each in a separate amniotic sac There were two placentae, one of normal size healthy, and with the cut cord of the living baby and its own amnion and chorion, was fused along one border with a shrivelled white fibrous one containing numerous infarcts and having two amniotic sacs, each containing one of the compressed foetuses, with two small cords and only one chorion The twin foetuses were both female and were not much macerated and were not deformed They were 9 inches long and weighed approximately 12 oz each

The further history of the case is also of interest *After a perfectly normal puerperium with no pyrexia and good involution, what appeared to be a complete succenturiate placenta* about 4 inches across, and with membrane attached was passed on the eleventh day The living baby for the first three weeks after birth suffered from projectile vomiting and intractable constipation and caused us some anxiety The pylorus was palpable and elongated and he lost weight considerably A diagnosis of congenital stenosis of the pylorus was made, but with small hourly feeds of expressed breast milk and daily stomach and occasional bowel washouts he made a good recovery and at one month had entirely ceased vomiting had nearly regained his birth weight, and was able to feed from the breast He has got on well ever since

Reviews

THE BACTERIOPHAGE

Le Phenomene de la Guerison dans les Maladies Infectieuses By F D Herelle (Pp 416 19 figures including 4 plates 75 fr) Paris Masson et Cie 1937

Professor F D Herelle has recently added to the already long list of monographs on the bacteriophage which come from his pen This last one bears the title *Le Phenomene de la Guerison dans les Maladies Infectieuses* but as a matter of fact it is only the second half of the monograph which deals with this problem the first two hundred pages being devoted to a consideration of the bacteriophage and the technique of its study Beginning with a brief historical account of the discovery of the bacteriophage the author considers in turn the technique of isolation of phages how to obtain them in pure culture the estimation of their virulence phage mutation and the characters and nature of bacteriophages All this is presented in lucid style and one notes that D Herelle adheres to his original conception of the bacteriophage as a living autonomous parasite of bacteria Considerable space is given to the question of the production of lysins by bacteriophages and one gathers that the author considers that bacterial mutation is the result of phage action —bacterium phage symbionts—and that opsonization of bacteria is brought about by phage lysins

In the second half of the monograph the author discusses the role of the bacteriophage in the recovery from disease and the evolution of epidemics For D Herelle recovery from bacterial infections is a function of phage action and cessation of epidemics is brought about by the dissemination of bacteriophage by convalescents Bacteriophage therapy of various bacterial diseases is also discussed and the results obtained are stated to be uniformly successful so much so that one wonders why other methods of treatment are still employed

X RAYS AND RADIUM IN DERMATOLOGY

X Rays and Radium in the Treatment of Diseases of the Skin By George M MacKee M D Third edition thoroughly revised (Pp 830 308 figures 31 charts 2 coloured plates 45s net) London Henry Kimpton 1938

There is no need to stress the importance of x rays and radium in the treatment of diseases of the skin In fact it is difficult to imagine what the practice of dermatology would be like if suddenly deprived of these powerful therapeutic agents The textbook before us which is now in its third edition is certainly the fullest and most complete account of the subject in the English language Dr MacKee has been interested in radiotherapeutics for many years and this book first appeared nearly twenty years ago In this the third edition he has had the benefit of the assistance of a large number of collaborators who have contributed chapters on those sections of which they have special knowledge In particular Dr Edith H Quimby has written important chapters on the physics biology apparatus, and measuring instruments required and dermatologists who wish to have more than a rule of thumb knowledge of what they are doing should study her writings with care

The clinical part of the book is mostly written by Dr MacKee himself whose clinical experience is unrivalled but in certain departments other physicians have collaborated with him There is also an interesting and important chapter on the medico legal aspects of x ray and radium therapy by Mr Harold Bouton This is founded of course upon the legal practice and procedure in vogue in the United States of America but after all since the legal system of this country is founded on the same principles it will be read with interest by British dermatologists Many will be anxious to see what opinion Dr MacKee has of the value of the so called Grenz rays which are really x rays of long wave length which will not penetrate ordinary glass and consequently necessitate the use of tubes in which a window made of special lithium borate glass is set to permit their escape Some optimistic workers have prophesied that these rays will one day entirely replace x rays of shorter wave-length in dermatology but Dr MacKee does not agree He is of opinion that enough work has not yet been done to substantiate the rather extravagant claims made by Bucky and others on their behalf We have to add that like most other American books this volume is well printed and well illustrated and well furnished with references to original papers It should be in every dermatologist's library

MEDICAL WOMEN IN PAST AGES

A History of Women in Medicine from the Earliest Times to the Beginning of the Nineteenth Century By Kate Campbell Hurd Mead M D (Pp 569 70 illustrations including a frontispiece 6 dollars) Haddam Connecticut The Haddam Press 1938

Dr Kate Hurd Mead deserves well of every woman who has adopted medicine as a profession She has read much and travelled widely to produce an excellent and well illustrated *History of Women in Medicine* It has the double merit of being interesting as well as accurate except for a few slight errors of fact The history begins with medicine in primitive times and is carried down the ages until the eighteenth century The method is to consider the practice of medicine by women in its relation to contemporary social history The book therefore contains many details of the domestic life of women at various periods independently of their professional work and this alone would make it attractive to the general as well as to the professional reader

It appears that from classical times until the end of the fourteenth century women held a recognized position in medicine acting for the most part as advisers often as curers of minor ailments and sometimes as operating surgeons Midwifery was always in their hands but in every country at one time or another they were licensed to practise medicine and in a few universities they were allowed to graduate on the same terms as the male students This was especially the case at Salerno and Dr Hurd-Mead makes a brave fight for the corporeal existence of Trotula the woman doctor whose influence on midwifery lasted for so many hundred years that her name has come down to our own times as Dame Trot Many great names are brought under review Dr Hurd Mead believes that both Moses and his wife Zipporah were instructed at the medical school at Heliopolis It is certain that Aristotle was helped by Pythias his wife in collecting material for some of his scientific treatises Many royal ladies were interested in and some actually practised the medical art St Hilda of Whitby Queen Margaret of Scotland the good Queen Maud (wife of Henry I) Eleanor of Aquitaine Berengaria and St Hildegard are all commemorated Then came a long period of eclipse when women were relegated to minor duties in the sick room though as in London in the seventeenth century they

received special instruction before they were licensed to practise as midwives

The book must necessarily reach a second edition, so a few minor errors may as well be pointed out The caption of the illustration facing page 232 is clearly wrong The ward is in a French, not an English, hospital, the sisters are engaged in the homely task of making the bolsters which preceded sandbags and not in sewing dead patients into their shrouds as is stated Mirfeld (p 262) was only in minor orders and was certainly never a prior, Mr John Flint South has been confused (p 269) with Sir James Paget and his work should be quoted as the memorials not the memories But these are only minor blemishes in a very satisfactory and pleasant book, which is provided with an excellent index and a list of errata

FRACTURES AND DISLOCATIONS

Fractures and Dislocations for Practitioners By Edwin O Geckeler M D (Pp 252, 213 figures 18s) London Baillière Tindall and Cox 1937

The author tells us in his preface that this book is written as a complete yet simplified guide to the management of bone and joint injuries, his purpose being to condense the subject of fractures and dislocations without omitting important details He has achieved his object in an attractive little work of convenient size, clear print, and good illustrations, and has been enabled to do so by adopting the sound policy of advising only what he considers the one most practical method of dealing with a particular lesion There is much to be said for this in a guidebook because, as the author points out, in emergencies the choice of the most appropriate treatment may be both confusing and time-consuming

The work is divided into two parts, the first dealing with fractures, the second with dislocations Provided the initial treatment is adequate, only a very small proportion of fractures require open reduction, and therefore description of operative technique has been limited to that of skeletal traction and subcutaneous leverage Plaster technique is explained in detail and an interesting chapter deals with follow up treatment This practical little guidebook should not only prove useful as a work for ready reference but also be of value to the busy practitioner who wishes with a minimum of effort to familiarize himself with modern methods of fracture treatment

APPROACH TO PHYSIOLOGY

The Living Body A Textbook in Human Physiology By Charles Herbert Best M D D Sc F R S and Norman Burke Taylor M D F R C S Ed (Pp 563, 283 figures 15 coloured plates 3 60 dollars) New York Henry Holt and Company 1938

The approach of students, including medical students, to the subject of physiology is a matter of the greatest moment Its basic importance to medicine, which can only be freed from mumbo-jumbo by a proper appreciation of its principles, together with its fundamental value as a subject of general education, make it one of the most useful of modern sciences As a rule the medical student at the outset of his physiological studies chooses one of the larger textbooks, often of vocational flavour, and most teachers will agree that the consequences of such an introduction are by no means good Yet teachers of the subject will also generally agree that elementary textbooks often leave much to be desired, or may even be positively misleading Leading investigators are often insufficiently acquainted with the broad outlines of the subject and competent teachers too occupied, or have too much of an eye to examination needs, to devote time and thought to the preparation of a book that might bring them little kudos, or even some scorn from their highbrow colleagues

It is a hopeful sign of the times that two such distinguished physiologists as Professors Best and Taylor, the one world-famous for his own research, the other as a teacher and investigator, should have bent themselves to such a task It is an agreeable task for a reviewer to be able to say that they have done a true service to their subject and that their work will be of value

In this book the main facts of physiology, brought right up to date, have been presented in a readable, informal, and accurate manner Apart from some of the half tone blocks which have come out poorly, the illustrations—283 in number—are well chosen and often original Some preliminary knowledge of physics and chemistry is assumed on the part of the reader, but little biology, histology, or anatomy is expected The authors state in their preface that the book is "written primarily for the usual college course in human physiology, a statement which indicates that Canada can give us points in general education they also had "in mind its use as a text in nursing schools as well as in the physiological instruction of dental and agricultural students Students of medicine may find it serviceable in gaining a bird eye view of the subject before reading more detailed texts' Its scope in Great Britain should be much the same, in fact we should be happy if nurses and dental students had knowledge to so good a standard The book is a good job well done, and it can be heartily recommended

STATISTICAL METHODS IN MEDICINE

The Treatment of Clinical and Laboratory Data An Introduction to Statistical Ideas and Methods for Medical and Dental Workers By Donald Mainland M B, Ch B D Sc (Pp 340, 23 figures 15s net) Edinburgh and London Oliver and Boyd 1938

Professor D Mainland's book, *The Treatment of Clinical and Laboratory Data*, like Dr A Bradford Hill's recently published *Principles of Medical Statistics* is intended to provide first aid to medical men and laboratory workers in the use of statistical methods Dr Hill's book covered a rather wider field Professor Mainland's book gives more detail, particularly with regard to the handling of small samples Practically all the methods of statistical analysis likely to be of use to a medical worker not primarily concerned with epidemiological or official vital statistics are lucidly explained or illustrated The methods of Professor R A Fisher rightly receive particular attention, indeed the book is in a sense, an introduction to that author's treatise, issued by the same publisher This, however, is not to say that Professor Mainland is a mere compiler At several places—for example, pp 131 *et seq* pp 283 *et seq* and in his discussion of the interpretations of particular results—criticisms and suggestions put forward have been the product of medical knowledge and experience well used We think the author's treatment sound We should, perhaps, have been inclined to stress even more than he does the limitations of usefulness of coefficients of correlation Galton's original idea of regression retains all its value, but few statisticians now attach much importance to coefficients of correlation 'in the air, dissociated from the notion of regression We have no doubt that any medical man or laboratory worker who reads this book carefully will avoid pitfalls in which many writers are entangled almost daily

Notes on Books

The *Year Book of Neurology Psychiatry and Endocrinology* continues its useful career In the volume for 1937 attention is called to the tendency to rely on the development of electric and acoustic technique to investigate the functions or dysfunctions of the nervous system though the editor regrets the lack of synthesis of the vast research material which leaves many clinical syndromes unexplained There is a full discussion of the treatment of schizophrenia by insulin and of the therapeutic value of oestrogenic hormones It is emphasized that the need for clinical discrimination in endocrinology is still urgent Towards that end this volume should certainly be helpful It is published in this country by H K Lewis and Co at 12s 6d (postage 6d)

GORDON W ALLPORT'S *Personality A Psychological Interpretation* is published by Constable and Company at 16s In this highly technical and not very readable book the author attempts to study the laws which determine the mental constitution of the individual in contrast to the general laws of mental process supposedly applicable to most or all individuals He defines personality as the dynamic organization within the individual of those psychophysical systems that determine his unique adjustments to his environment In order to understand personality the units of analysis must not be too simple and the author lays stress on what he calls traits The book is divided into five parts The first is historical and discusses the various methods of approach The second discusses the origins growth and maturation of personality the third and fourth the units of structure and analysis of personality respectively and the fifth the understanding of personality

Mental Deficiency by J DUNCAN is published by C A Watts and Company as No 10 of their Changing World Library and costs half a crown It is a pleasantly written essay which covers the ground from the educational rather than the medical point of view since the author is headmaster of a special school He lays stress on the importance of the backward group in the population and points out that both these and the feeble minded may learn though they can only be taught with difficulty and that modern methods of education may not be best suited to their needs He regards this group as potentially of great danger to the community and thinks that the only solution lies in selective breeding the spread of birth control knowledge among the lower classes in the true sense of the word and some measure of State control over those who have produced mentally defective children

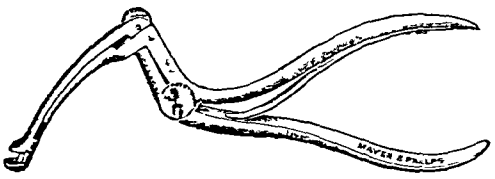
Gestalt psychology has won many adherents amongst those interested in both normal and abnormal mental processes That the mind deals with units of fairly elaborate complexity rather than with conglomerations of sense perceptions seems a reasonable conception and is certainly useful in helping to explain many phenomena which obtrude themselves on our attention in the study of mental mechanisms *A Source Book of Gestalt Psychology* by WILLIS D ELLIS (Kegan Paul 21s) is a well arranged series of abstracts in English of the papers published chiefly in German between 1912 and 1929 on which the theory has been built up The reader may discover from these that Gestalt psychology is not merely an armchair construction of what perhaps might happen—and if it did how convenient it would be for our understanding of the mind—but that it is derived from a long series of controlled experiments both of animals and man The author has sought and has certainly largely succeeded in giving experimental respectability to his subject

The first edition of Dr C SEYFARTH'S little book *Der Arzte Knigge* on the duties responsibilities and behaviour of hospital residents was noticed in this column on October 26 1935 That a third edition has now been called for seems a proof of its usefulness The publisher is Georg Thieme of Leipzig price RM 4 80 plus 2% per cent abroad

Dr H E COX'S *Chemical Analysis of Foods* is a useful little laboratory manual which has proved its worth by the call for a second edition The new edition (J and A Churchill 21s) shows manifold signs of attentive revision and although there is no great increase in the bulk of its contents the new presentation is such as to give the book the stamp of being fully up to date The matter is condensed to the extent necessary for its usefulness as a laboratory manual but is nevertheless adequately descriptive Apart from the requirements of unusual investigations this book will provide a working scheme for the chemical analyses of all ordinary foods

Preparations and Appliances

A MASTOID BRIDGE FORCEPS



Mr T G WILSON M B F R C S I (Dublin) writes

It has often occurred to me while performing the radical mastoid operation that the final stages of removing the bridge would be much facilitated by the use of a suitable punch forceps The instrument makers catalogues illustrate several forceps which could be used for the purpose but none of them seemed to me quite satisfactory I therefore commissioned Messrs Maver and Phelps to make up a bridge forceps to my design as illustrated by the accompanying engraving Its principal features are two

(1) The angle of bite is greater than a right angle so that the lower jaw can more readily fit into the aditus

(2) The curved shank allows the action of cutting to be easily seen

The instrument is made on sound and therefore efficient mechanical principles The method of use is quite simple

The bridge is reduced to a thickness of about one-eighth inch or more in the case of children by the usual method It is then seized by the forceps and cut away with a slight rocking motion After this mallet and chisel are again resorted to but the use of the forceps will be found to have saved a considerable amount of time To junior surgeons with whom the facial nerve is still a bugbear as well as a landmark the added security given by the use of the forceps should prove a boon

OVARIAN HORMONES

The gynoestryl products (Roussel Laboratories Ltd 30 Cavendish Square W 1) include the following products (1) Gynoestryl tablets each of which contains 0 025 mg oestradiol (250 international units) (2) Benzo gynoestryl ampoules which contain *oestradiol benzoate in strengths of* 0 1 1 and 5 mg per ampoule Oestradiol benzoate 1 mg corresponds to 10 000 international units (3) Sedo gynoestryl ampoules which contain oestradiol 0 1 mg with sodium bromide and hyoscyamus extract

Ovarian hormones are finding increasing clinical uses The makers suggest a total dosage 1 to 2 mg. by mouth of oestradiol benzoate for treatment of ovarian hypofunction and about ten times this dose for treatment of severe ovarian deficiency

THE PLYMOUTH MEETING

The pace set by the organizers of Annual Meetings has of recent years perceptibly quickened Each successor has determined not to be outdone by his predecessor—and even to outdo him So long as the desire to emulate does not provoke too much anxiety or strain, this competition in the production of excellence should be all to the good But perhaps the time has come when they may well ask themselves the difficult question, "Wherein does excellence lie?" Is it in the magnificence of the receptions, the number of the excursions the tonnage consumed of food and drink, the intensity of private and public hilarity? Before this question is examined further it must be said at once that Plymouth with the high example set it by Belfast, played to perfection the part of generous and charitable host The city took the B M A into the ordered routine of its domestic existence with such a friendly disregard of pomp and circumstance that for a short week the visitor felt himself indeed to be a Plymothian Each Annual Meeting has its own atmosphere, and the prevailing emotional tone of the Plymouth Meeting was one of domestic friendliness It was a family affair, and it was fittingly presided over by one who for years had been a family doctor, Dr Colin Lindsay It was a happy chance that at this moment, when the general practitioner is being assailed from all points of the compass, he should find himself so worthily represented in such high office by one who epitomizes in his own person those qualities of sincerity and integrity that are the hall-mark of the English doctor The need for such men is paramount

Dr Lindsay was ably and energetically seconded by those two hard-working members of any Annual Meeting team—the Honorary Local General Secretary Mr Cyril F Mayne, and his assistant Dr T T P Murphy We should like, too, to pay tribute to the gracious President of the Ladies' Section, Mrs Lindsay, and to all those who, working under her guidance arranged things so well for the wives and daughters of the menfolk These efforts were aided by the beautiful country round Plymouth the rivers and the moorland and the warm sunny weather that prevailed and were seconded by the kind attentions of the Civic and Naval authorities The scene was set for enjoyment We would not for one moment undervalue the importance of the social side of an Annual Meeting, nor even suggest that this was too heavily stressed at Plymouth But attention should be drawn to the fact that during recent years social events have tended to lure people from the Scientific Sections This is not to the good The excellence of an Annual Meeting must in the last resort reside in the debates conducted by the Representative Body and the discussions held at the Section meetings The latter, coinciding with the height of the social activities and coming towards the end of the meeting, inevitably suffer more than the former - The "representative mind" comes off decidedly worse than the Representative Body, which argues a lack of balance between the two

The generally poor attendance at the Scientific Sections was by no means a reflection on the standard of the papers read or of the discussions that followed them One of the most successful was the combined meeting of the Sections of Orthopaedics and Fractures and of Neurology and Psychological Medicine, when Professor Joseph S Barr drew attention to the significance of the prolapsed disk in the aetiology and treatment of sciatica and Professor H Olivecrona to the possibility of treating spasmodic torticollis by section of the cervical nerves The discussion on organotherapy held by the Section of Medicine attracted a good deal of attention, and in that on anxiety states in general and industrial medicine the remark of one speaker that it was important to "get hold of the children" drew from Dr T A Ross the apt retort that it was more important first of all to get hold of the medical student But the most stirring event was the description given by Mr R R Blewett of the medical and social changes that had taken place at St Day, a derelict mining area in Cornwall We would also mention the excellent films that were demonstrated on the three days the Scientific Sections met, those by Mr L O'Shaughnessy on surgery of the heart and by Dr C C Ungley on liver therapy and on polyneuritis being of special interest

The Annual Representative Meeting was notable for one event—the last appearance in an official capacity of Dr C O Hawthorne, who has decided no longer to seek election to the Council The warm reception that greeted him on the platform must have assured him of the affection and esteem in which he has been held for many years His gift of silvery speech and his constant upholding of principle when this was in danger of being overcome by expediency have for long been the admiration and instruction of those who listened to him In spite of Dr Hawthorne's

eloquent and logical opposition the Representative Body voted overwhelmingly in favour of the recommendation that a measure of recognition be accorded to chiropodists One of those who argued on behalf of this recommendation spoke with gratitude of the chiropodist who had "spotted' two cases of diabetes for him which perhaps rather begs the question What is a chiropodist' Apart from this the meeting was enlivened by a discussion on the activities of the Association in the field of propaganda and publicity and the Representatives went into committee so that the fullest freedom of speech could be allowed The champion of democratic principles Dr Murray of Banff made an eloquent attack on what he considered to be the unconstitutional action of the Council in setting in train a new line of policy without first of all consulting the Divisions But his indictment was more than matched by the masterly presentation of the case for' by the Chairman of Council who as a speaker goes from strength to strength His skill in debate coupled with the quick watchfulness of the Chairman of the Representative Body for any departure from the business in hand indeed made the platform appear at times too strong for those in the body of the meeting Nevertheless the Representative Body showed on more than one occasion that it had a lively sense of its responsibilities and was zealous on behalf of the rights of the general practitioner as could be seen in the modification it secured of paragraph 101 of the revised scheme for a General Medical Service for the Nation

The local and the national newspapers have always been generous in the attention they pay to the Annual Meetings of the Association, and it is not safe to make comparisons between this year and former years But the impression remains that printers ink has flowed more freely than before and that there has been more comment and more informed comment than previously This must be to the general advantage because the public in many respects is still lamentably ignorant of the aims of Medicine and the means it wishes to adopt to achieve them

THERAPEUTIC ABORTION AND THE LAW

The true physician s only desire is to do his best for his patient His problem is often to choose between two evils the possible ill effects of his treatment and the probable consequences if he does nothing The gynaecologist sees many pregnant women who if they go to term will probably suffer some harm This may be slight or so grave that it will almost certainly cause death In many of these cases he is convinced that an abortion is in the best interests of the patient His choice however is complicated by the knowledge that if he terminates pregnancy he will destroy a potential life and also that the law forbids abortion in some circumstances Many doctors have for a long time been anxious to know exactly what the law allowed them and did not allow them to do They found one answer only The Offences Against the Person Act 1861 Sect 58 said that a person who 'unlawfully' used an instrument with intent to procure the miscarriage of a woman committed a felony for which he could be punished with penal servitude for life They asked the meaning of 'unlawfully and were told that it had never been defined either by Parliament or by a judge but that the law almost certainly allowed the termination of pregnancy for the purpose of saving the mother s life When they discussed the subject among themselves they found wide variations of opinion on what the law was—apart from much wider variations of opinion on what the law ought to be They felt anxious and insecure and a strong movement grew up among them to have the law clarified

At the same time a number of lawyers who had paid special attention to the problem were aware that the law was vague but felt convinced that this very vagueness was a good thing They realized much better than the doctors the essence of the English legal system a man may do anything which is not expressly prohibited by law and where authority is lacking the law is written in the hearts of the people to be interpreted by the judges The undefined word unlawfully' allowed the authorities to give the medical profession whom they knew to be with very few exceptions not only responsible but conscientious a free hand to decide for themselves what was lawful in therapeutic abortion The lawyers were content in other words to assume that an abortion was carried out lawfully when a doctor performed it in good conscience after careful thought and observation and under proper conditions for the substantial benefit of the patient They felt that so long as the law refrained from saying what a doctor could do the question of what he could not do need not arise so long as he acted bona fide he could be left outside the sphere of criminal law and practice altogether and the police could devote their energies to detecting and prosecuting the people against whom the statute was directed—namely the professional abortionists lay or medical, about the unlawfulness of whose activities there was no possible doubt This attitude however did not allay the anxiety of medical men and

the situation was resolved last week in an English court of law

Mr Aleck Bourne has for some time been among the chief of those who have desired to know clearly where they stood under the law He is a leading obstetric surgeon with keen clinical and psychological insight He felt that in some cases, to do his best for his patient he must perform an abortion He also felt that the true interpretation of the law must allow abortion where it was in the best interests of the patient and he formed the resolution to take the first suitable opportunity of having the legal position made clear In this country a legal ruling can only be obtained in relation to a particular case, whether it be a civil action or a criminal prosecution He was therefore prepared to take the extreme course of risking his liberty, life's work, and reputation by submitting to a criminal prosecution in which the Crown would differ from him on the interpretation of the word 'unlawfully" As it happened, when the suitable occasion arose he was barred by a promise of secrecy from actively presenting himself as a sacrifice and it is understood that the Crown moved on information which he had not supplied A girl less than fifteen years of age was assaulted by some soldiers and raped under as revolting a set of circumstances as could be imagined She became pregnant and was taken to see Mr Bourne, who admitted her to St Mary's Hospital for observation He had a strong bias from the beginning in favour of an abortion but he did not perform it until he had satisfied himself, by tests and observation, that the girl would in all probability if she had gone to term, have suffered grave and lasting nervous damage which would have expressed itself in psychoneurotic and physical illness perhaps for the whole of her life Though he acted openly, he did not consult any of his colleagues, his reason being that in such cases he was accustomed to act as the 'second opinion" himself He was charged under Sect 58 of the Act of 1861 with unlawfully using an instrument with intent to cause miscarriage and the case turned on the interpretation for the first time of the word 'unlawfully"

The trial took place on July 18 and 19 at the Old Bailey before Mr Justice Macnaghten [1] and will long be remembered as one of the most remarkable that has ever taken place even in the Old Bailey The accused was treated throughout with admiration and respect his motives were regarded with what must have been almost unanimous approval It was less a criminal trial than a co-operative effort by judge, jury, counsel, and witnesses to create law out of strong but ill-defined feeling The foundation was laid by the judge after the Attorney-General, Sir Donald Somervell, K C had closed the Crown case he defined the word "unlawfully" by importing a phrase from the Infant Life Preservation Act 1929 That Act was passed to prevent the killing of a child in the short interval when it is capable of being born alive and therefore comes outside the law of abortion but has not yet acquired an existence independent of that of its mother and therefore cannot in law be murdered Sect 1 of that Act contains a proviso that no person shall be found guilty of the offence of child destruction unless it is proved that the act which caused the death of the child was not done in good faith for the purpose only of preserving the life of the mother The learned judge held that this proviso expressed what had always been the law in regard to abortion and was implicit in the word "unlawfully" of the 1861 Act He therefore ruled that the question for the jury would be "Has the prosecution proved to your satisfaction, beyond reasonable doubt, that the act which Mr Bourne admittedly did was not done in good faith for the purpose only of preserving the life of the mother?"

No one doubted Mr Bourne's good faith, but he himself admitted that he had not acted to save the girl from immediate death The next step in the case was therefore to determine the meaning of the phrase 'preserving the life of the mother" There was no doubt that the girl's health would almost certainly have been gravely injured In fact, the Attorney-General greatly clarified the case by admitting as much at the end of his closing speech He said, "I do not minimize the possible mental effects of which Mr Bourne and the other doctors spoke The question is whether those mental effects, grave as they are, justify under the law the termination of pregnancy" In answering that question the judge used words which will probably be quoted for a long time to come as a statement of the attitude which the law requires of the doctor who performs a therapeutic abortion He said, in effect, that no line can be drawn between danger to life and danger to health, that no doctor knows whether life is in danger until the patient is dead, and that if on reasonable grounds, based on adequate knowledge after consultation with colleagues, a doctor forms the opinion that the probable consequences of the continuance of pregnancy would make the woman a physical or a mental wreck then he is not only entitled, but it is his duty, to perform an abortion In saying this his Lordship was—most fortunately—saying that the law and the physician's duty are in harmony To preserve a woman's life he implied is not merely to save her from death, it is also to save

[1] *British Medical Journal* July 23 1938 pp 199–205

her from illness which would destroy so much of her life that it would hardly be worth living With this view the jury agreed as is shown by their verdict and it is now the declared law until it is corrected or modified by the Court of Criminal Appeal in some other case

The trial Rex v Bourne has therefore ventilated the whole subject of therapeutic abortion and produced a statement of the law which substantially allows the conscientious medical man to do what he has been doing already But the law hitherto vague has now been clarified and after the Ministry of Health s Inter-Departmental Committee on Abortion (the Birkett Committee) has issued its report it may be clarified still more

TREATMENT OF MALARIA

Methods for the treatment of malaria and particularly for personal prophylaxis still furnish a field for controversy as two recent *Bulletins of the Health Organization of the League of Nations* show [1] Despite the claims and hopes that have arisen the drug prophylaxis of malaria is still far from satisfactory It is true that plasmoquine in relatively large doses can exert a lethal action on sporozoites but in doses which may safely be continued for long periods its value is very slight neither can atebrin excepting in large doses nor quinine be considered true causal prophylactics since experimental evidence which is supported by practical experience shows that their action on sporozoites is doubtful The findings of the third report of the Malaria Commission published in June 1933 based upon experiments with *P vivax* therefore still stand Up to the present no drug is known which when taken in harmless doses during the period of infection will effectively destroy the causal organism of malaria (sporozoites) before they are able to continue their life cycle in the human host Nevertheless the regular use of either quinine or atebrin may be of value through the inhibiting effect these drugs exert upon the development of the asexual forms of the malaria parasite whereby clinical manifestations are damped down or suppressed For this purpose atebrin has not proved clearly superior to quinine and possibly may be more toxic Furthermore the harmlessness of quinine makes it a suitable drug for administration by subordinate personnel without constant medical supervision whereas such supervision is essential in the case of atebrin There therefore seems little ground for displacing the established daily dose of 5 grains of quinine where personal prophylaxis of malaria is practised The report concludes that in primary infections a mean daily dose of 15 grains of quinine may bring about the disappearance of trophozoites of benign tertian or quartan malaria on an average on the third day although relapses occur in a percentage of individuals which may be as high as 50 in the case of malignant tertian infections doses up to 30 grains daily may be necessary Quinine in the doses indicated exercises its parasiticidal activities on the young forms of *P vivax* and *P malariae* capable of producing gametocytes and also on fully developed gametocytes but on the fully developed gametocytes of *P falciparum* its action is only very slight Quinine therapy with the usual dose has no adverse effect on the patient s general condition and is generally free from depressive or toxic action if the period of administration is limited to the number of days strictly necessary nor is there any good reason for thinking that this treatment hinders the process of immunization Atebrin in daily doses of 0 3 gramme has a slightly more rapid action on trophozoites of *P vivax* and *P malariae* than quinine in the usual dose of 15 grains on the trophozoites of *P falciparum* differences between the strains of parasites prevent the drawing of uniform conclusions The parasiticidal action appears to continue for a longer period in that the phase of latency lasts rather longer after the end of treatment than with quinine The action on gametocytes is like that of quinine Unfortunately the yellow coloration of the skin is a disadvantage especially during prolonged prophylactic treatment and the drug may have other toxic effects The action of plasmoquine on the trophozoites of *P vivax* and *P malariae* is slight and on those of *P falciparum* almost *nil* though on the gametocytes its effect is marked There is therefore no advantage in using plasmoquine alone to combat the symptoms of an acute attack in any of the forms of malaria The simultaneous administration of atebrin and plasmoquine appears to aggravate the toxicity of each and is not to be advised The consecutive treatment with atebrin first followed by plasmoquine has no appreciable influence on the clinical manifestations or the proportion of trophozoites in the blood but the method has the advantage of decreasing and devitalizing the gametocytes especially those of *P falciparum* moreover from the clinical point of view it diminishes substantially the number of relapses The combined use of quinine with plasmoquine causes less frequent and less intense toxic symptoms than that of atebrin with plasmoquine There is therefore no particular contraindication to the simultaneous use of quinine and plasmoquine and the method has the advantage that the duration of treatment is shortened It is stated that the association of quinine with plasmoquine represents one of the most efficacious methods of treating benign tertian and quartan malaria Average doses of quinine and plasmoquine greatly reduce (perhaps more than any other method) the number of relapses in benign tertian and in some cases also in malignant tertian

CALCIUM AND THE FOETUS

The quantity of calcium administered annually to pregnant women is so enormous as to be only computed in terms of tonnage for it has become customary to prescribe this mineral almost as a routine during pregnancy That this is justified has been proved in innumerable researches and it is certain that it effectively prevents the almost universal drop in serum calcium in the later months of gestation The effect on the foetus

has however, been generally ignored and Finola and his colleagues[1] have now drawn attention to possible dangers in this connexion In an exhaustive investigation they found that the normal foetal excess of serum calcium and inorganic phosphorus was increased by the administration of these minerals during pregnancy and that there was moreover definite evidence of increased bone density in the majority of infants born of mothers so treated The significance of this latter finding leaps to the eye for it is obvious that excessive osteosclerosis in the foetal skull might restrict moulding In the great majority of cases this is of little importance, but it is conceivable that it might be crucial in a "tight fit" disproportionate labour That this does not occur more often is perhaps due to the fact that calcium is usually prescribed in a practically unassimilable form, but where it is given scientifically (as dicalcium phosphate combined witht vitamin D) this possible cause of dystocia should be borne in mind and the drug supplied to women with undersized pelves only where indicated by an abnormally low calcium content

RESPIRATORY MOVEMENTS IN COLLAPSED LUNGS

The movements of the lung when collapsed by an artificial pneumothorax have been studied radiologically by Andrew L Banyai[2] In each patient radiographs were taken at the end of inspiration and expiration, the margin of the collapsed lung was outlined, and the pulmonary area was measured by means of a planimeter The radiological-respiratory ratio—that is a hundred times the radiological area at maximum expiration divided by the radiological area at maximum inspiration—was then calculated This ratio is inversely proportional to the extent of the respiratory excursion In collapsed lungs it varied from 54 to 99, indicating that in some patients respiratory movement persists in such degree that the radiological area of the lung in inspiration is almost twice as large as that in expiration, whereas in others the respiratory excursions of the treated lung are almost *nil* Banyai found that so long as the intrapleural pressure remained negative the movements of the affected lung were determined mainly by the stage of deflation and the movements of the overlying thorax, he indicates how both these factors are to be measured Changes in this relationship may be caused by various factors such as the extent and type of the tuberculous lesion and particularly the presence or absence of extensive fibrosis or consolidation pleural effusion extensive adhesions contraction of the thorax, the condition of the respiratory muscles, and the extent and type of disease in the contralateral lung The radiological-respiratory ratio was between 50 and 69 in half the patients investigated, between 70 and 89 in 45 per cent, and between 90 and 99 in only 5 per cent A comparison with a control group of normal persons showed that a respiratory ratio between 90 and 99 was not found in healthy individuals, on the other hand the proportion of respiratory ratios between 50 and 59, indicating marked respiratory excursions was four times greater in the pneumothorax group than in the controls The author emphasizes the fact that the conclusions based on investigation of the movement of the entire collapsed lung are not applicable to the diseased part of that lung The movement of the affected area was less than that of the uninvolved area in 63 per cent of cases, equal to it in 25 per cent, and more than that of the unaffected lung area in the remaining 12 per cent When the radiological respiratory ratios derived from the measurement of forced respirations are reduced proportionately to a level corresponding to that of quiet respiration, it becomes apparent that the respiratory excursions of a diseased area can be substantially restricted by an artificial pneumothorax Marked limitation of movement followed the induction of a pneumothorax in 19 5 per cent of cases, and these patients had respiratory ratios between 90 and 99, which do not exist in normal persons Further comparison with healthy adults showed that the proportion of respiratory ratios between 80 and 89, indicating limited movement, was more than three times greater in the group in which the movements of the diseased area in a collapsed lung were measured than in the controls Occasionally, however a pneumothorax seems to increase rather than decrease the respiratory excursions of the diseased lung Finally, comparison of the respiratory excursions of the lung before and during treatment by artificial pneumothorax revealed that the movement of the diseased area of the treated lung was less than that of the entire lung before treatment in 54 5 per cent, the movement of the two areas was much the same in 18 per cent, and the extent of the movements of the diseased area during treatment was greater than that of the entire lung before treatment in 27 3 per cent

"THE SIGN OF THE CLAVICLE"

As far back as 1927 Dr G C Higoumenakis[1] of the staff of the Evanghelismos Hospital (Athens) and head of the skin and venereal diseases departments drew attention to the fact that in congenital syphilis the sternal end of the clavicle is sometimes enlarged, and since then he has come to the conclusion that it is one of the most certain and most common stigmata of the disease and is met with neither in healthy persons nor in those with acquired syphilis The swelling is due to a hyperostosis resulting from a syphilitic osteitis and there are three reasons why it should occur at this site The first is anatomical The inner third of the clavicle is derived from a secondary centre which appears from the eighteenth to the twentieth year whereas the acromial end and middle are ossified each from a centre which appears from the thirtieth to the thirty-fifth day of intra-uterine life Also, the ossification of the clavicle takes place directly from connective tissue and unlike the other long bones, without preformed cartilage Secondly, the *Sp pallida* has a predilection for connective and lymphatic tissue Thirdly, by reason of its function the sternal end of the clavicle—particularly the right—is irritated by

[1] *Ann Derm Syph* Paris 1937, 8, 939

continued shocks due to the movement of the arm and being membranous bone like the flat bones of the skull is a convenient place for the *Sp pallida* to settle in When the patient begins to use the arms the extra stress stirs up the spirochaetes and an osteitis is set up (In this connexion it is interesting to note that the author has demonstrated thirteen cases in which the left clavicle has been involved in left handed people) In support of his thesis Dr Higoumenakis quotes a number of other observers including French American and Greek who have also noted the sign and claim to have proved its syphilitic import The ages of twenty patients who showed the clavicular sign varied from 15 to 56 no very young children are included The Wassermann reaction was negative in eleven cases positive in eight and not stated in one Fourteen of these patients seem to have been fairly typical cases of congenital syphilis and one was apparently a case of third generation syphilis but the diagnosis of hereditary syphilis is not altogether convincing in the other five The author claims that the value of the ' sign of the clavicle in the diagnosis of congenital syphilis is greater than that of other stigmata on account of its frequency and the ease with which it is demonstrated It would be interesting to know in what percentage of cases of undoubted congenital syphilis this sign occurs since its existence does not seem to have been recognized by many eminent syphilologists and also whether it ever occurs in acquired syphilis or in other conditions A more detailed description of the pathological and radiological findings would be invaluable including an examination of sections for the *Sp pallida* In the meantime syphilologists would do well to keep a watchful eye for this sign and maintain an open mind with regard to its frequency and diagnostic significance

OPHTHALMOLOGICAL SOCIETY OF AUSTRALIA (B M A)

In this country we are accustomed to the formation and existence of independent clinical societies which are the meeting grounds of groups of local practitioners or of wider groups of practitioners who are engaged in some form of special medical work Our Association was originally a combination of the former and each Annual Meeting provides the latter to some degree in the Scientific Sections Nevertheless independent societies still exist because of our liking for old traditions There are weaknesses inherent in the small independent societies for they can rarely unite for common action In Australia the members of the B M A have evolved a more excellent way The ophthalmologists of the Commonwealth felt they needed a society in which those practising this branch of medicine could unite for the advancement of their specialty by meetings publications libraries and museums research work and the provision of prizes for research work and by postgraduate lectures Instead of starting an independent body they have formed such a society within the Association— The Ophthalmological Society of Australia (British Medical Association) Those eligible for ordinary membership are all those members of the B M A who specialize in ophthalmology and whose qualifications are approved by the Council of the Society Its rules show that it is completely autonomous yet it is part of the Association The first president is Sir James Barrett (who was President of the Association in 1935) with Dr James Flynn as vice president Dr Darcy Williams honorary secretary and Dr Leonard Mitchell honorary treasurer We congratulate our Australian colleagues upon their achievement and wish the new society every success An article in the *Medical Journal of Australia* of April 9 ends thus We welcome an intramural society with the hope that its success may induce some of the existing extramural bodies to become part and parcel of the British Medical Association That is a hope that might be fulfilled nearer home

THROMBOCYTOPENIC PURPURA FROM SEDORMID

An enormous number of new synthetic drugs have been introduced during the present century and many of them have become firmly established in clinical use In recent years there have been some notorious proofs of the fact that it takes a long time to discover all the potentialities of a new drug The occasional appearance of toxic jaundice after cinchophen and of agranulocytosis after amidopyrin are cases which illustrate this point Thrombocytopenic purpura has been known for some time to be caused by a variety of therapeutic agents—for example x rays radium benzene arsphenamine and quinine Five new cases of thrombocytic purpura induced by sedormid have been reported recently [1] This effect is rather surprising because sedormid (allyl isopropyl acetyl carbamide) does not contain a benzene ring and it is aromatic compounds which most often lead to undesirable changes in the blood Hoffman and his colleagues[1] suggest that the carbamide radical may be the active toxic agent Thrombocytopenic purpura after sedormid is evidently a very uncommon side effect of this drug since only about a dozen cases have been reported in the literature Its occurrence is however of interest as providing a new example of the curious idiosyncrasies that are being brought to light by the increasing use of a wide variety of synthetic drugs

MEDICAL RESEARCH COUNCIL

By an Order of the Committee of Privy Council made after consultation with the Medical Research Council and with the President of the Royal Society C R Harington, Ph D F R S (professor of pathological chemistry in the University of London) and W W C Topley M D F R C P F R S (professor of bacteriology and immunology in the University of London) are appointed members of the Medical Research Council in succession to Professor A J Clark M D F R C P F R S and Sir John Ledingham D Sc F R C P F R S who retire in rotation on September 30

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

FRACTURES IN THE REGION OF THE ELBOW-JOINT

BY

S L HIGGS, F R C S

Fractures involving the elbow are common, especially in children and their treatment is often a matter of difficulty and anxiety Although painful at the time, there may be no very obvious deformity or alarming incapacity, as in the case of a broken leg, and parents are apt to regard treatment as a simple matter and blame the doctor if the result does not come up to expectations

Reduction may be difficult or impossible without surgical intervention Restoration of movement may be slow or imperfect because of the peculiar liability of the elbow region to form excess of bone and undergo fibrosis around the joint Deformity through interference with growth may be unavoidable At least some of these dangers and difficulties should be pointed out to those concerned at the beginning rather than wait until they arise Efficient treatment demands x ray examination, repeated as often as necessary probably a general anaesthetic and adequate nursing and supervision, at any rate for a day or two Where unhappy results occur it is usually found that in order to save trouble or expense some of these measures have been neglected Failure to provide the best treatment must be made the responsibility of the patient or parents as the case may be, and not of the doctor

Supracondylar Fractures

A fall on to the extended arm in an adult is likely to cause a dislocation of the elbow but in a child the weakest point is just above the lower epiphysis of the humerus and this common type of injury will produce a supracondylar fracture The most usual age is between 8 and 12 years The condition is easily recognized The arm hangs straight or is supported with the other hand Palpation may help very little because of the swelling but the slight backward displacement of the elbow combined with the unnatural side to side movement makes the diagnosis clear enough Movements of the finger and the hand should be tested in order to detect possible nerve injury

First aid consists in supporting the elbow in the position of deformity with a thick layer of wool and bandage perhaps combined with a light splint No attempt whatever should be made to bend up the elbow or to reduce the fracture until preparations have been made Although the longer the fracture is left the more difficult reduction becomes this applies to days and not to hours There is therefore time enough to allow the child to get over the immediate effects of the accident to obtain some x-ray films of both elbows for comparison and to allow a reasonable period to elapse since the last meal before giving a full general anaesthetic Gas is not enough, and local anaesthetics are unsuitable in the case of children

REDUCTION

Reduction is accomplished in the following manner An assistant steadies the upper arm while firm traction is applied to the pronated forearm with the elbow in extension While still maintaining the pull on the forearm the elbow is flexed gradually, and at the same time forward pressure is applied to the olecranon and lower end of the humerus by the thumb of the operator's other hand The sensation of reduction should be experienced If it is not, the lower fragment has probably got caught behind the shaft, and further flexion must not be pressed When reduction takes place the forward position is maintained by thumb pressure, while any side displacement is checked and corrected The elbow is then brought up into full but not forced flexion, in which position the fracture is stable The forearm should be pronated to relax the muscles, which otherwise tend to rotate the lower fragment

How should this position be maintained with security and safety? A collar-and-cuff sling supports the wrist from below the neck, but may cause twisting of the fracture and subsequent loss of the 'carrying angle' Strapping which encircles the flexed arm may cause danger from pressure, and must not be employed A satisfactory method is to apply a wet plaster-of-Paris "slab," made from a four-inch bandage, direct to the back of the elbow from the top of the upper arm to the palm of the hand At no point does it go more than half-way round the limb, and it cannot constrict It is closely moulded to the skin, and so gives firm support It is held in position by a few turns of bandage around the forearm and upper arm, but nothing whatever encircles the elbow itself The bend of the elbow is therefore uncovered and free for inspection When set the whole is supported in a sling Without delay an x ray examination should be made to check the position If this is unsatisfactory the arm must be dropped again into semi extension until a further attempt is made The child should remain in bed for twenty-four hours at least with the arm resting on a pillow and a constant watch should be kept for any disturbance of the circulation The signs of this are pain, congestion, and numbness of the fingers and weakness or loss of voluntary movements These are the danger signals of beginning ischaemia The fracture itself becomes a matter of secondary importance All pressure in the antecubital region must immediately be relieved by removing everything from the limb and reducing the flexion of the elbow It should be remembered that it is not as a rule the swelling and flexed position alone which cause pressure, but flexion in the presence of an unreduced fracture Hence the importance of obtaining x ray evidence of reduction before resting content

AFTER-TREATMENT

After-treatment consists in maintaining fixation until union of the fracture is firm This usually takes four weeks At the end of this time the plaster splint is removed and a collar-and-cuff sling substituted In a few days by gradually lengthening the sling, the elbow may be let down to a right angle, and then an ordinary sling can be substituted Active movements are encouraged and a careful watch kept for any tendency for the range of flexion to become diminished This may indicate the occurrence of myositis ossificans which would demand a further period of rest Radiographs will show this

The last stage before full movement is restored may take many months The parents must be made to understand it

massage vigorous stretching or manipulation of the joint would not only retard recovery but probably lead to still further stiffness In certain cases some treatment from a reliable masseuse who will help to restore the child's confidence but confine herself to heat and gentle active movements and exercises may help the situation and prevent the parents from seeking unskilled advice

Fractures of the Condyles

Injuries which cause either abduction or adduction strains of the elbow may lead to fractures of either the outer or the inner side of the lower end of the humerus They occur most commonly in children because of the weakness associated with the multiple centres of ossification For the accurate interpretation of radiographs a knowledge of these ossific centres and their appearance at different ages is necessary Mistakes however may be avoided if exactly corresponding films are taken of the uninjured and the injured elbow Careful comparison will disclose an abnormality and the error of mistaking a separate bony centre for a fracture is avoided It must be remembered that the lower end of the humerus in early childhood is largely cartilaginous and that a torn off epicondyle may be much larger than the x ray appearance suggests

INTERNAL CONDYLE

Forcible abduction of the elbow joint at any age up to 16 may cause avulsion of this part of the bone through a pull exerted by the attached flexor group of forearm muscles The importance of the injury lies in the close proximity of the ulnar nerve which may be damaged at the time or become the seat of delayed neuritis in after years Exact diagnosis of the injury is not always easy without an *x* ray examination but if displacement has occurred a movable lump can be felt below and in front of the normal situation of the epicondyle and there is lateral instability of the joint with a great deal of bruising Nerve pressure symptoms must be sought Treatment depends upon the degree of the injury

1 *Fractures without displacement* can be treated with a collar and cuff sling for a fortnight and afterwards the resumption of active use

2 *Fractures with downward displacement* are best treated by open operation The steps of this consist of first a dissecting free of the ulnar nerve which is often tightly stretched across the broken surfaces then reposition of the condyle and attached muscles fixing them in place by a few catgut stitches or a beef bone peg and lastly the transposition of the ulnar nerve to a muscle bed in front of the condyle to make sure that it will escape a traumatic neuritis later on The arm is fixed in flexion by means of a posterior plaster splint for three weeks and then active movements are begun If for any reason surgical treatment is impossible a fair result as regards function follows treatment by simply keeping the elbow flexed for three weeks The condyle will not unite however and some lateral instability of the joint will persist together with a variable degree of cubitus varus deformity Furthermore there is the risk of ulnar nerve irritation from friction behind the irregular condyle

3 *Fracture with Displacement of Condyle into Joint*—Although by manipulative methods it has been found possible to extricate the condyle yet in almost all cases operative treatment is necessary The ulnar nerve is often affected from the beginning and this may demand exploration The condyle is fixed back in position and the freed nerve transposed to the front

EXTERNAL CONDYLE

Fractures of the external condyle usually involve a part of the articular portion of the humerus and are not confined to the epicondyle itself In children particularly the large fragment may carry the whole of the capitellum and even part of the trochlear surface For purposes of treatment there are two varieties first fractures without displacement which should be dealt with on the lines of a supracondylar fracture secondly those with displacement In the latter the broken off portion is pulled out of the joint and drawn downwards by the muscles and operative treatment is imperative This may not prove a very easy matter as the fragment is often rotated and at a distance from the joint Some patience may be necessary to make out exactly how to fit it back without separating its muscle attachments When in place it may be secured by a catgut stitch or by a small beef bone peg The elbow is held at a right angle with the forearm supinated and the wrist a little dorsiflexed by means of a posterior plaster slab and bandage This is retained for three weeks before starting gentle active movements No physical treatment is required

Fractures of Head of Radius

A point to remember is that a supposedly sprained elbow may often contain a fractured radial head It is usually produced by a fall on to the hand There are none of the signs of gross fracture Pain in the elbow on twisting the wrist is suggestive Examination with the thumb over the radio humeral joint while rotating the forearm with the other hand will reveal localized tenderness limitation of movement and often irregularity of the head of the bone X ray examination will show the type of fracture and determine the line of treatment

1 *A crack with little or no displacement* should be treated by fixing the elbow in full flexion with the arm in supination This position is most easily maintained by a very light posterior plaster splint supported by a collar and cuff sling It should be retained for a month after which a sling should be worn for a further week Exercises and active movements are to be encouraged but movements especially extension are slow to return

2 *Fractures of a segment with displacement* do very badly with conservative treatment Pain and stiffness persist and traumatic arthritis develops later in the elbow-joint The broken off fragment should be removed by operation without delay The radio humeral joint is approached through a lateral incision which passes just behind and below the external epicondyle The muscles are raised for a short distance from their origin and the capsule of the joint incised The joint will be full of blood and when this has been cleared away the damage can be inspected The broken segment and any small fragments are removed as gently as possible leaving the standing portion of the head if this is undamaged Sometimes the articular cartilage of the adjoining capitellum is broken and rough It should be made smooth with a knife and a sharp spoon The capsule is closed and the muscles are replaced with a few interrupted catgut sutures and the skin with interrupted stitches The exposure and work inside the joint are carried out with bleeding controlled by an Esmarch bandage but in no circumstances should this be left on for more than half an hour

3 *Comminuted fractures of the radial head* demand surgical treatment The whole of the head should be removed together with any loose fragments After partial or complete excision of the radial head the arm is supported at a right angle by means of a thick layer of wool

and a firm bandage Rotation movements of the forearm are encouraged from the start, and flexion and extension of the elbow after a fortnight

Fractures of Olecranon

In these cases the question to be decided is whether or not to advise operation The age and occupation of the patient, which arm is injured, and the degree of comminution or separation of the fracture must all be taken into consideration The pull of the triceps and consequent separation cannot be efficiently overcome by any method of splinting, not even in full extension with strapping and pads Bony union will not be secured, but nevertheless a remarkably useful arm may result from a fibrous union with separation of the fragments

In elderly patients who are not required to do hard manual work the best course is to support the arm in a sling at a right angle and encourage active use from the beginning In all other cases operative treatment is the method of choice It should be carried out as soon as the skin condition is surgically satisfactory Only a few points of technique need be mentioned The patient lies prone with the arm stretched out from the side and with the front of the elbow resting on a flat sandbag An Esmarch bandage is used for the first part of the operation The incision should be a curved one, passing to the inner side of the point of the elbow The resulting scar is not in an exposed position and is hardly visible—an important point in women patients Aluminium-bronze wire, made of many strands and flexible for tying, or two strands of strong fishing-gut, will serve to hold the fragments together Silver wire is quite unsuitable The wire should lie within the bone, only emerging at the sides of the lower fragment, to get a grip on the cortex, and deep in the triceps insertion where the knot is tied A flexed post operative position of the elbow is desirable, but the amount of flexion will depend on the security of the fragments This can be tested before sewing up the wound A posterior plaster slab outside the dressings aids fixation and comfort In the average case active movements may be started in three weeks

Nova et Vetera

BICENTENARY OF BOERHAAVE'S DEATH

Friday September 23, 1938, will be the two hundredth anniversary of the death of Herman Boerhaave, the leading physician of his age At Leyden where he practised and died the Nederlandsche Maatschappij tot bevordering der Geneeskunst, in association with other learned bodies in Holland, will commemorate the occasion Dutch physicians and colleagues from other countries have been invited to pay homage to Boerhaave and a commemorative volume is to be prepared, which besides the addresses given on September 23, will include tributes from foreign physicians, botanists and chemists At the end of the ceremony a wreath will be laid before the statue of Boerhaave and visits will be paid to the church where he is buried to the old wards of the former St Cecilia Hospital where he taught clinical medicine, and to his country seat Poelgeest near Leyden The following day has been set apart for an excursion to the village of Voorhout where Boerhaave was born on December 31 1668 and thence to Harderwijk, the ancient little town near the Zuyder Zee, where formerly stood a university in which Boerhaave graduated M D on July 15, 1693 The arrangements are in the hands of a committee headed by Dr L C Kersbergen of Haarlem, whose office address is Keizersgracht 327, Amsterdam

Before turning to the study of medicine Boerhaave took his degree in philosophy at Leyden in 1689, in 1701 he was appointed lecturer on the institutes of medicine at Leyden and in 1709 professor of botany and medicine In 1714 he was appointed rector of the university and professor of practical medicine, and four years later professor of chemistry In 1728 he was elected into the French Academy of Sciences, and in 1730 the Royal Society of London made him a Fellow "His genius so raised the fame of the University of Leyden, especially as a school of medicine, that it became the resort of strangers from every part of Europe"

BENJAMIN TARNOWSKY, 1838-1906

Professor Benjamin Tarnowsky, the first Russian syphilologist, was born on July 9, 1838, in Poltava After medical education at Moscow, where he qualified in 1859, he went to Paris, where he studied syphilology and urology under Ricord On his return to Russia he settled in St Petersburg where he became attached to the Kalinkine Female Lock Hospital In 1863 he published his lectures on the diagnosis of syphilis in women and children, the first Russian manual on venereal diseases In 1868 he was appointed to the Military Medical Academy of St Petersburg where he lectured to young soldiers on the dangers of exposure to venereal disease, and was made assistant professor of syphilology in the medical faculty, becoming full professor three years later He also founded a school for the special education of midwives in syphilology In 1885 he founded a society of dermatology and syphilology which was the first society of the kind not only in Russia but also in the world, and served as its president for many years In addition to numerous original articles on various aspects of venereal disease most of which he published in the *Archiv für Dermatologie und Syphilis* Tarnowsky translated Lancereaux's monograph on syphilis His work met with wide recognition both at home and abroad The Russian Government conferred on him various distinctions, and he was elected honorary member of numerous Russian and foreign medical societies Throughout his married life he received valuable help from his wife Dr Pauline Tarnowsky, who was one of the first medical women in Russia and was well known for her work on psychiatry and craniology His death took place on May 17, 1906

HEINRICH MEIBOM, 1638-1700

From the stately days of the seventeenth century to recall into the hurried atmosphere of modern specialization the name of Meibomius, the tercentenary of whose birth occurred on June 29, engenders feelings of envy and melancholy regret Though he has found a narrow memorial in the Meibomian glands of the eyelids which he described so accurately in 1666 (De vasis palpebrarum novis, epistola) —these had previously been noticed by Giulio Casserio (1561-1616)—through the very act of eponymous commemoration however pious, we tend to drift away from the man behind the name Like so many of his contemporaries he was indeed a child of Apollo god of culture, poetry, rhetoric and healing While still a medical student (he became M D at Angers in 1663) he was appointed to and in 1664 took up the professorship of medicine in the University of Helmstedt Fourteen years later he accepted the additional chairs of history and of poetry He further showed his versatility by straying into the pleasant fields of archaeology, philology and philosophy and all his life he was an insatiate traveller His father, Johann Heinrich Meibom is a familiar figure in medical history, but his son, Brandanus, also a physician is a comparative stranger

A PERSONAL EXPERIENCE OF TETANUS

We print below an abridged account of a personal experience by TREVOR H KNIGHTS M B Ch B N Z of the Baptist Mission Hospital Yakusu Belgian Congo It has been communicated to the *Journal* by Dr C C Chesterman O B E medical officer and secretary Baptist Missionary Society 19 Furnival Street London E C

Source of the Infection

In November 1937 a native patient operated on in the Yakusu Hospital for a large hydrocele suddenly developed trismus and died forty eight hours after the onset of symptoms There are no horses or cattle in the region and tetanus has always been considered as exceedingly rare or non existent The source of the infection remained obscure but thanks to the help of Professor Geoffrey Hadfield M D F R C P of St Bartholomew s Hospital cultures have since been made of a large variety of materials from the hospital and have resulted in a growth of *Cl tetani* of slightly diminished virulence being obtained from the sweepings of the theatre floor Whether these came from or were the source of the original native infection is unknown but precautions have now been taken to prevent soiling of the theatre floor by the feet of those whose duty it is to enter it

Two months later January 19 1938 Dr Knights interrupted his morning list of operations between the clean and septic cases and removed with the help of his native dresser a couple of irritable pigmented moles one from his left arm and the other from his right forearm Novocain 2 per cent was used and the wounds were dressed and strapped with elastoplast no catgut was used Both wounds were subsequently irritable and neither healed by first intention

Onset and a Canoe Trip

Dr Knights writes

On the twelfth day after the operation January 31 1938 away on a bush journey I had a headache and slight dysphagia Next day the dysphagia had gone but I had an irresistible desire to yawn without the momentary relief from weariness which usually follows this exercise My face felt tied up but I failed to detect risus sardonicus in the mirror and dismissed it as tetanophobia and cycled fifteen miles to inspect a dispensary

At 7 a m next morning I set out on a similar errand but felt tired after the twenty-eight-mile non stop ride Lying down on the hard table of the rest house I took a drink and suddenly my jaws went into spasm Hurriedly altering notes I had written to various native chiefs and colleagues about my future plans I completed the inspection of the dispensary had a short sleep on the table and changed my clothes sodden with perspiration at the unsuccessful efforts to take a meal and rode back twenty eight miles through a tropical downpour to the river bank

While waiting for paddlers for the canoe I turned up Tidy and found I had probably four days to live Returning later to find my messenger still propping up the doorway I remonstrated a little angrily when suddenly my laryngeal muscles went into spasm and the resulting shriek sent the native off at the double

At last with no doubts left in my mind I began the long two-day canoe trip up to Yakusu taking only a few drugs and papers leaving my other kit as never wanting it again I lay on a deck chair covered with a camp bed mattress in an open canoe and as evening fell found that my back was stiffening so that at midnight I was very glad to be lifted out on to another rest house table just as a storm was brewing I passed the remainder of the night fitfully dozing amid the snores of paddlers the thunder and the noise of the rain on the leaf roof In the blackness of early morning I was assisted down through the elephant grass to the beach and we got off once more poling and paddling past the flickering lights of the fires in passing canoes The shimmer over the water gave me a headache but beyond an aspirin I took no drugs as I wanted to keep my head clear having several reports to make and money matters to arrange

The entry in my personally made case notes at this time was Stiffness of jaws still more marked in moving spasm Neck still remains free of stiffness which is noted across back Eating an agony and brings on free perspiration Spasm of left arm with hand in accoucheur s position Spasm of body legs arms and across chest

At 2 p m we drew alongside the Mission motor boat in which my colleague Dr Browne had responded to an urgent forest call that morning and to which he was due to return at dusk A native engineer took matters in hand and insisted on putting me on board and taking me up to Yakusu but though physically easier lying on the cane bunk I was tortured with the thought that I with so little chance of survival had possibly delayed somebody else with a less er complaint

Twenty eight hours after setting out on this trip which I felt was the last in my life I was once more living on a decent bed The only serum we had 6 000 units was injected by the nurse as an intramuscular barrage and a cyclist sent off to Stanleyville for more At 5 a m next morning Dr Browne arrived in the motor boat which had returned to fetch him Later I had 65 000 units A T S (non concentrated variety) intramuscularly

Horrors of Opisthotonos

That night I woke after a few hours sleep with the feeling that something was about to happen It was and did! Suddenly a great hand seemed to take me across the chest rendering respiration impossible Another two such hands forced my head backwards towards my heels and my heels towards my neck while my whole body poured perspiration I felt some of the dorsal musculature give way with a tearing agony and this made the pain worse at the slightest movement

By the tenth day from the onset I was thoroughly worn out and began to have thoughts of turning in the struggle even requesting two grains of morphine when my colleagues saw that I was in unbearable agony By this time I was making vocal protestation which relieved my feelings each time I felt the drumming pulse and tightening compression of my chest muscles

Then came the greatest contraction of all when I am told my pulse became imperceptible and my respiration ceased for two minutes Then the miracle for I dropped off to sleep and woke knowing I was going to live and though stiff as a ramrod and very weak felt that no more convulsions were coming my way and neither did they

In conclusion I would like to pay heartfelt gratitude to my colleague Dr Browne and to the nursing staff whose skilful care and unremitting attention are without doubt responsible for my being able to tell this somewhat adventurous tale

An Objective Postscript

Mr Stanley Browne F R C S., M R C P adds the following note

The eighth and ninth days of this illness showed a clinical picture of rapidly increasing seriousness but the will to live was very strong the patient voluntarily sucking up fluids through a rubber tube together with chloral and bromides

On the ninth evening I gave him 70 000 units A T S intravenously and 9 000 intramuscularly Lumbar puncture was impossible as he begged me not to give him an anaesthetic At this time morphine seemed to have no effect The symptoms were complicated by bromide rash and a serum rash and catheterization was necessary

Convalescence was complicated by an acute internal derangement of the right knee probably caused by a fatty fringe a condition from which he had suffered before when exhausted or emaciated The heart was dilated and a systolic mitral murmur appeared An impulse on coughing over the ruptured right quadratus lumborum disappeared and flat feet were prevented by massage and exercises

ELECTRICAL IGNITION OF ANAESTHETICS

BY

H W SWANN

His Majesty's Senior Electrical Inspector of Factories

Two papers on electrical ignition of inflammable anaesthetics were recently read at the Institution of Electrical Engineers and, with the discussion which followed, showed that useful research work has been done towards reducing the risk. The purpose of this article is to summarize the more recent contributions to the subject and to suggest their application in practice.

Whilst explosions attended by serious results are fortunately rare the Ministry of Health in 1935 thought it desirable to issue a memorandum entitled "Precautions Against Anaesthetic Explosions in Operating Theatres"* This was of a preliminary character, and may be supplemented now that further information is available. The Ministry is aware of a number of accidents, information on which has been gathered from various sources. Although this figure may bear no relation to the actual number of cases, it indicates where the chief risk may lie.

TABLE I

Cause of Ignition (Electricity)	Non Fatal	Fatal	Total
Static electricity	3	4	7
Surgical lamp in mouth	2	4	6
Cauteries	1	3	4
Surgical diathermy	2	1	3
Hot nozzle dental syringe		1	1
Table lamp (switch)	1		1
X ray apparatus	1		1
Totals	10	13	23

Table I summarizes the information available, and it will be seen that in recent years twenty-three cases of explosion are known to have occurred in this country and abroad which are attributed to electrical ignition in some form or other.

The Chief Risks

It will be noted that static electricity and the use of surgical lamps in the mouth constitute the chief risk, and although some degree of danger must inevitably attend the use of the general electrical equipment for lighting sterilizing, ventilating, etc., attention has focused on the first two causations especially as Coste and Chaplin† have found by experiment that the room distribution of ether vapour during operations under open-mask anaesthesia resulted in low concentrations. The air at about two inches from the patient's mouth contained less ether than would form an explosive mixture, and the proportion fell off rapidly as the distance from the patient increased.

Another bearing on the subject may be obtained from a statement by Dr. H. W. Featherstone‡ to the effect that from time to time he had heard of a minor pop when a small lighted electric bulb had been inserted into the mouth during ether–air anaesthesia. Dr. Featherstone described a case in which an explosion occurred in the patient's mouth and was attributed to defective contact between the lamp and the holder which caused a spark. He also discussed the possibilities of the leakage of ether into the gas stream even when the anaesthetist, in endeavouring to guard against risk, thought he had shut it off.

These and other opinions indicated that attention should be focused, in the first instance at least, on the electrical ignition risks in the immediate vicinity of the patient, and of these risks those attending nose and throat operations appeared to be the most important. It must not be assumed, however, that risk in other positions can be dismissed as negligible, especially where ventilation is bad. Dr. C. F. Hadfield* particularly stresses the danger of foot switches in relation to accumulations of ether vapour at floor level.

Intrinsic Safety Surgical Lamps

There is a wide variation in the design, construction, and maintenance of the different forms of surgical lamps in use, and with the limitations necessarily imposed on size, and the need of sterilization, it becomes difficult to suggest forms of construction which could be considered gas tight or immune from electrical defect. While there is little doubt that from the point of view of ignition risk design could be improved, it was thought that there was more hope in the direction of intrinsically safe circuits, which, if practicable, could be applied with less difficulty and delay. This principle has many successful industrial applications, but it was realized that there was no experience with mixtures possessing the inflammable characteristics of ether–oxygen. The problem has, however, been tackled by Professor W. M. Thornton†, whose researches are detailed in a paper read on February 24, 1938, at the Institution of Electrical Engineers. Thornton found that with hot wires, such as cauteries, ignition can occur within limits as wide as 3 to 80 per cent. of ether in oxygen. With sparks the limits are in general much narrower. The researches described determine these limits and also the least currents that cause ignition when broken slowly or suddenly or by fusing wires. Second only to hot wires as a possible risk are the fizzling sparks which may occur between fine wire ends, such as at an intermittent break in a fine wire flexible. Thornton found that when the current is kept below certain well defined values ignition did not take place, and thus he was able to specify the resistance for any given voltage which would limit the current in that circuit to safe values. This resistance is, of course, located at the source of energy—for example, battery or transformer—and is independent of lamp or other circuit resistances. Its effect is to limit the energy, which appears as a spark caused by an open or short circuit anywhere in that circuit. Thornton advocated a factor of safety of 2 as being an ample margin. Table II. takes account of this, and is amplified by a graph (Fig. 1).

TABLE II

Direct Current		Alternating Current	
Volts	Minimum Safe Limiting Resistance	Volts	Minimum Safe Limiting Resistance
0—2	0·25 ohms	0—2	1·25 ohms
2—4	1·25 „	2—4	6·00 „
4—6	3·25 „	4—6	14·00 „
6—8	7·00 „	6—8	25·00 „
8—12	27·00 „	8—13·5	54·00 „

The curves relate to fizzling sparks, which over most of the range of the experiments were the more dangerous. It is worthy of note, however, that the curve for plain break A C would cross the fizzling break at about 12·1 volts, which means that the plain break may become the more dangerous at voltages above this figure. Similarly, the curve for plain break D C would cross the fizzling break curve at 3 volts, and thus again plain break may be

the more dangerous below that figure Only the fizzling curves are shown and the scale figures on the right hand ordinate are those found experimentally by Thornton while those on the left side allow a factor of safety of 2

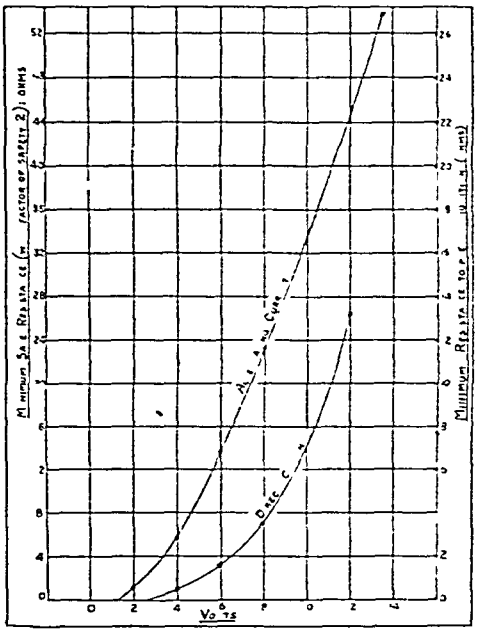

FIG 1—Curves for Fizzling Sparks

Hot wire Ignition and Spark Ignition

Thornton distinguished between hot wire ignition and spark ignition and the importance of the point has been brought out by Dr H L Saunders PhD FIC who found that although circuits incorporating the prescribed value of resistance may be safe as regards most forms of sparks a special case arises when a circuit is completed through a single strand of fine wire which may get hot Under certain conditions the temperature of the ether mixture may thus be raised above its ignition point causing explosion or sufficiently to predispose to spark ignition should the fine wire break Intermittent contact in a partly broken flexible conductor involving a combination of hot wire heating and sparking is undoubtedly the most insidious form of danger as a much smaller spark energy may be enough to cause an explosion This is a particularly difficult case to define accurately and may not be fully covered by Thornton's formulae Very finely stranded flexible is thus likely to be more dangerous than coarse strands as the heating will be greater in the last strand to break just before severance due to wear and tear

Saunders has suggested that the only safeguard against this dangerous combination is to test the resistance of the circuit regularly A partial break in a flexible will show up as an increase above the usual resistance and indicate the need for examination and repair Lamp resistances vary and it would be best to replace lamps by a low value of constant resistance for purposes of the test advocated

The "Cool Flame

Another aspect of the subject with an important bearing on the risk of ignition has been pointed out by Dr D T A Townend* in connexion with that peculiar type of combustion usually referred to as a cool flame In the case of ether–air mixtures in a 2·5-cm tube there is a range of inflammable mixtures which at atmospheric pressure is capable of normal flame explosion between about 3 and 9 per cent of ether in air and a quite distinct range for the cool flame between about 19 and 24 per cent of ether in air Within the normal flame range the mixture can be ignited by sparks but to initiate a cool flame it is necessary to use a hot wire—a distinction of great importance Townend places the ignition temperature range of cool flame between *circa* 170 and 270 C and describes cool flame combustion as very incomplete and invisible except in darkness The flames travel slowly with a speed of something like 20 cm per second in a tube 3·5 cm in diameter and at about atmospheric pressure which is that approximately customary in anaesthesia the ranges overlap as the normal flame range starts at about 250 C

Much the same type of system is formed with ether–oxygen enriched mixtures as with ether–air mixtures though with the former the ranges are naturally much wider Townend showed that a cool flame initiated by hot wire could travel some distance in a tube leaving behind it incompletely burnt products capable of normal flame explosion and ignitable from the preceding cool flame Thus where the velocity of the supply of anaesthetic is low a cool flame initiated at the patient's mask during anaesthesia may travel back along the rubber tube to the gas producing equipment and may cause a normal explosion either by ignition as above or on encountering a more explosive mixture

Townend also discussed the possibility that although sparks of *normal* intensity such as those from an induction coil or a broken wire do not initiate cool flame there may be a range of *weak* spark intensities capable of doing so and the point has an obvious bearing on explosions caused by static sparks which may attract the attention of an interested investigator

Overrunning Surgical Lamp Bulbs

Surgical lamps are often used in conjunction with some form of regulating resistance which allows of overrunning The little bulbs are as a rule rated at between 2·5 to 3·5 volts and when overrun to the point of burning out the glass may reach temperatures capable of igniting ether mixtures A valuable contribution to this subject has been made by Mr C T A Harper who has measured bulb temperatures of typical lamps when overrun to an extent causing collapse and burning out of filaments He employed a special fine thermocouple which was kept in intimate contact with the bulb thus avoiding the use of material which might act as lagging and so produce a higher temperature than would normally be obtained Capped lamps did not reach such high temperatures as uncapped bulbs possibly owing to the increased area of dissipation and it is worthy of note that in no case did the collapse of the filament result in bursting or damage to the bulb

Harper recorded his measurements on graphs of which Table III is a summary The graphs are reproduced as Figs 2 3 4 and 5

TABLE III

Description			Bulb Temperature		
				At Burn-out of Filament	
Type of Lamp	Number Tested	Rated Voltage	At Rated Voltage (Average)	Lowest Value Noted	Highest Value Noted
Surgical uncapped	4	2.5	120° C.	305° C.	359° C.
Pharyngoscope capped	5	3.5	60° C.	158° C.	230° C.
Urethroscope capped	4	3.5	80° C.	165° C.	250° C.
Ward's flexible capped	4	3.5	70° C.	218° C.	270° C.

In most cases the filaments appear to burn out at just under double the rated voltage

* Discussion on Professor Thornton's paper February 24 1938 the Institution of Electrical Engineers

The importance of this work is seen when it is remembered that the ignition temperature range for normal ether-flame explosions lies between 250° and 350° C and for a cool flame between 170° and 270° C It seems likely that some explosions in anaesthesia may have been due to overrunning, as it is believed that burning out of bulbs from this cause is not uncommon The limiting resistance specified by Thornton for intrinsically safe circuits tends to diminish the risk of overrunning, but it will be obvious that it is in addition necessary that the rated voltage of the lamps should not be materially less than the voltage of the battery or transformer constituting the source of supply An intrinsically safe 6-volt circuit would still allow a 2 5-volt lamp to be dangerously overrun

CONCLUSIONS

The following conclusions may now be drawn as to the conditions under which surgical lamps may be used with comparative safety in the presence of inflammable ether–oxygen mixtures

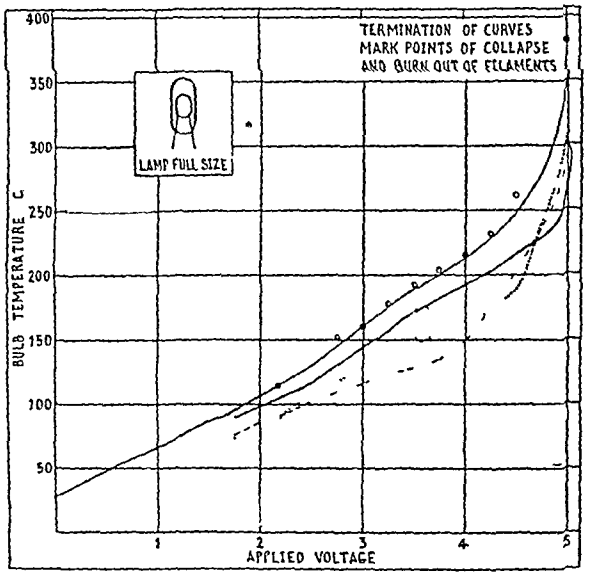

FIG 2—Relation between applied voltage and bulb temperature Surgical lamp, 2 5 volts, uncapped

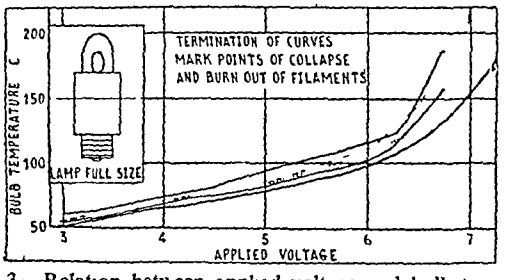

FIG 3—Relation between applied voltage and bulb temperature Pharyngoscope lamp, 3 5 volts capped

1 The adoption of Thornton's formulae for intrinsically safe circuits will prevent any form of spark ignition on either A C or D C circuits

2 The danger of hot-spot or hot-wire ignition, or a combination of this with sparking at the moment when the last strand of a flexible breaks, may be minimized by a regular test of the circuit resistance and the keeping of records

3 The supply voltage should not exceed the rated voltage of capped lamps by more than 25 per cent Uncapped lamps should not be overrun

Experiments made to demonstrate the utility of circuits conforming to conclusions 1 and 3 above showed that a useful degree of light was obtainable, especially on D C circuits At the higher values of A C voltage the inductive effect has led to the necessity of high values of resistance, which diminish the light considerably The utility of the battery-fed circuit is therefore the greater

Static Electricity

Although the climate of this country can as a rule be depended upon to produce a degree of humidity which is incompatible with the retention of static charges, the modern practice of supplying large buildings with cleaned and conditioned air tends to neutralize the climate, and Dr Rayner has presented a paper,* read on February 24, 1938, at the Institution of Electrical Engineers, which is devoted to a study of the manner in which static charges can be built up in operating theatres Explosions attributed to static have occurred, and it has been found that rubber-tyred vehicles used for carrying patients can be electrified by withdrawing a warm dry blanket Bulgin† says that an ordinary standard tyre of specific resistance 10^8 to 10^9 ohms will generate enough static to raise the potential of any vehicle to about 5,000 volts at a speed of ten miles an hour on a smooth road during warm weather If sparks are produced in these or other ways they may jump not only to an earthed object or person but also to a rubber-tyred vehicle carrying an anaesthetic equipment Thus the most likely place for static appears to be in the immediate vicinity of the patient, where the risk of ether concentration is greatest

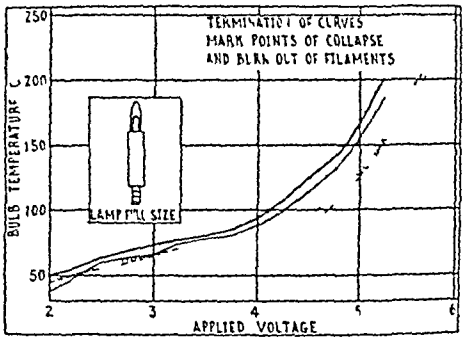

FIG 4—Relation between applied voltage and bulb temperature Urethroscope lamp 3 5 volts, capped

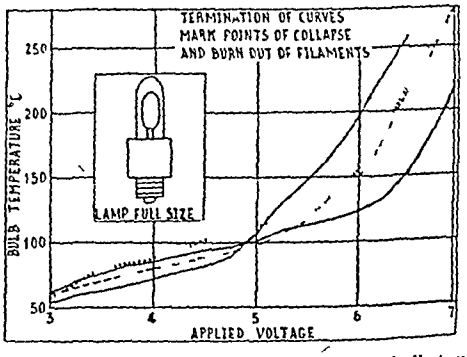

FIG 5—Relation between applied voltage and bulb temperature Lamp for Ward's Flexible, 3 5 volts, capped

The risk with rubber-tyred vehicles is easily overcome by the use of light trailing chains, but there is a good deal of misconception as to the conditions under which these are likely to be successful Chains are usually effective on most floor surfaces, excepting rubber and linoleum, and quite high surface resistances, of the order of 100,000 ohms, are permissible The point is easily settled in individual cases by producing electrification *without* a trailing

* 'The Risk of Explosion due to Electrification in Operating Theatres of Hospitals,' by Dr E H Rayner M A D Sc Dr Rayner's work was done at the National Physical Laboratory for the Department of Scientific and Industrial Research in consultation with the Anaesthetics Committee jointly appointed by the Medical Research Council and the Royal Society of Medicine

† Discussion on Dr Rayner's paper, February 24, 1938, Institution of Electrical Engineers

chain and then attempting to repeat it after the chain has been attached In the absence of a suitable instrument a charge can be detected by holding a finger tip about one-eighth of an inch away from the metal work of the vehicle while a dry blanket is smartly pulled away

A form of rubber possessing conductive properties has recently been developed with special reference to the risk of static in operating theatres and has several similar industrial applications It can be used in the shape of tyres or in sheets for flooring but low values of resistance are both unnecessary and apt to be dangerous Rubber is inherently inflammable and if the resistance is low there is risk of fire should electrical leakage occur through it as for instance from a defective vacuum cleaner or a defective pedestal type lighting standard At 230 volts a specific resistance of the order of 100 000 to 150 000 ohms should be free of fire risk and yet quite effective for dispersal of static

Electrical practice has always associated *non* conducting properties with any form of rubber and if accidents are to be avoided it is imperative that the new conductive variety should be plainly marked in a permanent manner It is known that the India Rubber Manufacturers Association has both resistance standardization and marking under consideration

Dr Rayner also gave attention to the possibility of static being produced at the anaesthetic equipment by discharge of gas from high pressure storage cylinders Some earlier work* on the electrification of oxygen cylinders has been done at Birmingham Central Technical College from which it was concluded that in the absence of foreign matter in the gas stream there appears to be no electrification The point is no doubt relevant also to cylinders containing carbon dioxide and nitrous oxide and as a high degree of purity is ensured in manufacturing and bottling the risk is small and may be minimized still further by maintaining electrical conductivity between all gas cylinders and other metal work comprising anaesthetic equipment supplemented by earthing either direct or through conductive rubber This measure will prevent sparking between components or to other bodies but does not deal with the rare case of combustion at the oxygen valve The design of the latter has however recently been improved by the elimination of ebonite for purposes of valve seating The usual precautions of opening valves gently and keeping them free from oil or grease are of course desirable

Gas cylinders may be located at a central point away from the operating theatres the gas supply being distributed by permanent pipe line This affords an opportunity for reducing the cylinder pressure in two stages that in the pipe line being maintained at say 60 lb per square inch This arrangement would reduce risk and has already been adopted in America and in a few cases in this country not only for the distribution of oxygen but also for nitrous oxide and other gases

In cases of exceptional dryness the use of rubber shoes may insulate the person sufficiently to allow static charges being set up by friction with the floor and of being carried Rayner found that a similar condition may arise with leather shoes on cork carpet This would mean the possibility of sparking from the finger tips a phenomenon almost unknown in this country but well recognized in very dry climates An effective safeguard lies in the use of conductive rubber for the shoes

CONCLUSIONS

The following conclusions may now be drawn as to the means of dispersing static charges

1 Rubber tyred vehicles should be earthed by trailing chains or conductive rubber

2 Electrical conductivity should be maintained between gas cylinders and other metal components of anaesthetic equipment and the equipment should be earthed direct or through conductive rubber Gas cylinders may with advantage be situated at a central point outside the theatres

3 In exceptional cases of dryness rubber shoes should be conductive

X Ray Apparatus and Electrical Equipment

The information recorded in Table I shows that although static and the use of surgical lamps constitute the chief risks there are other matters which may probably be regarded as of secondary importance such as the diagnostic use of x ray apparatus during anaesthesia and the general electrical equipment of the theatre Surgical diathermy or the use of cauteries in the presence of an inflammable anaesthetic would of course be a mistake but modern forms of x ray equipment probably introduce little risk except as regards defects such as in flexible conductors during use The general electrical equipment—pendants switches plugs sterilizers etc—is not as a rule in the immediate vicinity of the patient but the degree of risk depends entirely on this factor and the fortunate lack of coincidence between an electrical defect and the presence of a mixture rich enough to ignite With the exception of mercury type switches there is little that can be suggested in connexion with the general equipment which would not involve revolutionary changes and thus the greatest importance attaches to efficient ventilation

Collaboration

The inquiries made in connexion with anaesthetic explosions and the result of the work described in this paper lead to the conclusion that some central representative body is required which could influence the design of electrical apparatus for the operating theatre or perhaps for the hospital as a whole and advise on its use The employment of electro medical apparatus is increasing as the applications of electricity become more numerous and such a body might without retarding progress foresee risks and combine the views and requirements of surgeons and engineers to the best advantage

STUDENTSHIPS AND FELLOWSHIPS IN CLINICAL SCIENCE AND EXPERIMENTAL PATHOLOGY

The Medical Research Council invite applications for a third series of studentships and fellowships intended to encourage young British medical graduates of special ability and original mind towards becoming investigators in those branches of medical science which are concerned directly with disease as it occurs in human beings This field of research includes investigations into disease or manifestations of disease in patients together with experimental work of an immediately relevant kind

Postgraduate Studentships—Postgraduate studentships are offered for medical graduates who have already held house appointments and are strongly inclined to a career in clinical science or experimental pathology Each student chosen will receive a stipend at the rate of £200 per annum during a period not exceeding twelve months for personal maintenance while undertaking approved courses of study in this country such as may be regarded as best calculated to advance his training in methods of research This study may include modern languages and such advanced physiological pathological and special clinical work under recognized teachers as may be regarded as forming a suitable preliminary to serious research work to be undertaken later but the approved course may not include studies of which the purpose is to enable the student to pass further examinations

Research Fellowships—The Council also offers research fellowships for candidates of similar qualifications who have already had some experience in the use of research methods Each fellowship will be tenable for one year at the ordinary value of £250 per annum and will be renewable in approved instances at the rate of £300 per annum for a second year These fellowships are intended as probationary appointments for research in clinical science or experimental pathology under suitable direction in this country Research expenses may be provided in addition to stipend Applications should be lodged with the Secretary Medical Research Council 38 Old Queen Street London S W 1 before October 1 1938 Forms for the purpose will be supplied on request.

ONE HUNDRED AND SIXTH ANNUAL MEETING

of the

British Medical Association

HELD IN PLYMOUTH, JULY, 1938

THE SECTIONS

SUMMARY OF PROCEEDINGS

During the next few months there will be published in the BRITISH MEDICAL JOURNAL *the opening papers communicated to the Scientific Sections of the Annual Meeting at Plymouth The reports of discussions in this and successive issues are intended to give members who were not present a general idea of the proceedings*

Wednesday July 20

Toxic Infective Jaundice

With the President of the Section, Dr T H G SHORL (Plymouth), in the chair, Dr C E LAKIN opened a discussion on toxic and infective jaundice

Dr C E Lakin said he accepted the conventional classification into obstructive haemolytic, and that form of the disease caused by liver damage He was concerned only with this last toxic or hepatogenous jaundice Exogenous poisons, bacterial toxins, virus infection, and autogenous intoxication were the principal causes of this disease, in which the patient was likely to be more ill than jaundiced Generally the stools remained normal in colour, but the urine might contain bile in addition to urobilin and albumin The liver parenchyma underwent pathological changes, ranging from the severe necrosis due to massive doses of toxin to gradual replacement fibrosis when the poison was less virulent According to present day conceptions acute yellow atrophy at one end of the scale and cirrhosis of the liver at the other fell into line Until recent years ordinary catarrhal jaundice had been regarded as a form of obstructive jaundice While there was pathological proof of this, a disease clinically indistinguishable occurred in epidemic form In a recent outbreak among nurses at the London Fever Hospital the incubation period appeared to be twenty one days The infecting organism had so far not been discovered, but in one epidemic nasopharyngeal 'droplet' infection seemed to be the method of spread Hurst had taken the view that there were two varieties of catarrhal jaundice, but Dr Lakin was doubtful of their existence He had seen cases of epidemic catarrhal jaundice ushered in with fever several days before the jaundice appeared, while vomiting and abdominal discomfort had shown themselves in the pre icteric period He found it difficult to differentiate these symptoms from those of the acute gastritis which were emphasized as preceding the obstructive form of catarrhal jaundice Perhaps a deeper jaundice and paler stools suggested a blocked duct, while enlargement of the spleen was more constant in mild subacute hepatitis The Van den Bergh and laevulose tolerance tests could not be relied upon to differentiate these diseases The work of Bloomfield in America had suggested that catarrhal jaundice might be followed by permanent or even progressive hepatic damage Dr Lakin had seen cases which supported this view, and he wondered whether changes of this type in the liver might explain the varying effect that alcohol had on different people

Professor G R CAMERON referred to the toxic substances which might damage the liver The pathological changes could be divided into four groups according to their severity In the most acute forms yellow atrophy produced rapid shrinkage of the liver and death, next came subacute atrophy, which was followed by a regenerative process, thirdly, less severe poisoning resulting in multiple nodular hyperplasia (toxic cirrhosis), with its brunt often on the right lobe, and, fourthly a slow pathological change, which might after some years be followed by primary carcinoma In two thirds of all cases the kidneys were affected, and in a smaller proportion the heart The action of hepatotoxic substances was influenced by the amount of the poison, the spacing of the doses, personal idiosyncrasy, diet, and the presence of associated infection The young were more susceptible than the old, while pregnancy and alcoholism might aggravate the effect of any poison

Major H C BROWN discussed Weil's disease, its occurrence in the British Isles, and its differential diagnosis In collaboration with Alston he had recorded 142 cases in Great Britain in four years from July, 1933 The causal organism was known to be carried in the kidneys of 41 per cent of brown rats Human infection took place through the abraded skin coming into contact with material contaminated with the urine of infected rats The disease could also be acquired from bathing in infected water Almost every case in the British Isles had been traced directly or indirectly to the agency of rats—for example, a dog bite might convey the disease if the dog had recently killed an infected rat Men were affected far more frequently than women, except in fish working and tripe dressing occupations in which many women were employed Differential diagnosis from epidemic catarrhal jaundice might be very difficult, prostration, ocular congestion albuminuria and haematuria were found in both diseases but the intense muscular pain in Weil's disease was an important factor in diagnosis The differential blood count was of value a polymorphonuclear count of 85 per cent or 90 per cent being usual in Weil's disease, whereas in epidemic catarrhal jaundice there was a considerable relative increase in the mononuclear cells Stokes and Ryle in Flanders had shown that many patients with Weil's disease were not jaundiced Obscure influenzal attacks among the labouring classes were to be looked upon with suspicion when association with rats could be traced

Dr G W M FINDLAY considered that the common form of infective hepatic jaundice was epidemic catarrhal jaundice, although obstructive cases certainly occurred Many workers in other countries had produced overwhelming evidence that the condition was a hepatitis He advocated replacing the term 'epidemic catarrhal jaundice' by epidemic hepatitis The aetiology was unknown, although a virus might be responsible the long incubation period of four to five weeks supported this All efforts to infect experimental animals had failed During recent work on immunization against yellow fever it became obvious that the initial slight reaction might be followed by jaundice several weeks or months afterwards This occurred in ninety-three out of 3,100 patients inoculated The urine became dark and the skin yellow a prodromal period with fever might occur the Van den Bergh reaction being diphasic It became clear that some virus was being cultivated in association with the strain of yellow fever virus in use subsequently methods had been found to abolish the risk of jaundice after these inoculations

Dr E R CULLINAN described a syndrome in which attacks of jaundice, without apparent cause, were associated with subacute necrosis of the liver In its early stages it might be confused with recurrent catarrhal jaundice, cholangitis, pancreatitis, Hanot's cirrhosis or biliary cirrhosis Later it might be difficult to differentiate the condition from splenic anaemia Banti's disease, or portal cirrhosis The onset resembled that of catarrhal jaundice, there was no fever or severe pain The jaundice often fluctuated The liver was enlarged but not the gall bladder The illness might be prolonged, and jaundice might last any period from two weeks to ten years Deepening jaundice with increasing anaemia, fever, and quick pulse heralded a fatal issue The Van den Bergh reaction

gave no help in the diagnosis but the lævulose tolerance test was important in distinguishing this disease from malignant obstructive jaundice Correct diagnosis as between these two conditions was essential as laparotomy in these cases was frequently fatal Treatment should include the administration of large amounts of glucose calcium and alkali were also of value

Sir ARTHUR HURST was convinced that there were two types of catarrhal jaundice In that associated with hepatitis the patient was more ill and had fewer preliminary symptoms the prognosis was good on the whole The lævulose tolerance test showed impaired liver function in this group while in obstructive catarrhal jaundice it gave a normal result He agreed that operation was extremely dangerous in toxic jaundice Cholecystography had sometimes been misleading as the absence of a gall bladder shadow might lead to the inference of gall bladder disease whereas the liver was actually at fault in being unable to excrete Atophan which was widely used in cases of arthritis was in his opinion a cause of toxic jaundice

Dr DONALD HUNTER made the broad clinical distinction between catarrhal jaundice and Weil's disease that in the former the patient was not ill whereas the latter was characterized by severe illness and haemorrhages The statement that Weil's disease occurred only in the poor might be misleading and he quoted the case of a well to do patient who died of this disease which he contracted while bathing in a contaminated stream He agreed with Sir Arthur Hurst that atophan was very dangerous and he never used it there were safe and effective drugs available for the treatment of gout Dr G S ASTON (Barnstaple) described his recent experience of epidemic catarrhal jaundice in three separate households His observations supported those of Dr Lakin in indicating a twenty one day incubation period Pain was not severe except in one case and several patients had prodromal symptoms Dr H F BELL WALKER (Balfour South Africa) described a form of epidemic jaundice which occurred in South Africa Fluctuation in the incidence of epidemic jaundice corresponded with plagues of rodents Rat bites were unusual but rat flea bites were common Many of the patients were children and there was no case to-case infection There was evidence that the infection resulted in permanent damage to the liver

SECTION OF SURGERY

Wednesday July 20

Acute Appendicitis

With Mr V ZACHARY COPE President of the Section in the chair Professor G GREY TURNER opening a discussion on the treatment of acute appendicitis stated that according to the Registrar General's statistics there were 3 000 deaths from appendicitis annually in Great Britain This was equal to 12 per cent of deaths from diseases of the digestive system and 0 61 per cent of deaths from all causes He had taken the combined figures of two large general hospitals—the London Hospital and the Royal Infirmary Newcastle—for the five years 1933-7 to determine the present position of operative mortality Of acute cases excluding localized abscess there were 6 725 with 247 deaths a mortality of 3 67 per cent In 604 cases with localized abscess there were fifty one deaths —8 44 per cent mortality These two acute groups combined gave a mortality rate of 4 07 per cent In the total series of 9 973 cases acute subacute and interval there were 308 deaths—a mortality rate of 3 10 per cent Appendicitis he said was at its inception a local disease and the essence of success was both early diagnosis and early operation Once infection was well established in the peritoneum or in the veins a secondary nidus was established which might go on in spite of removal of the original focus As to early diagnosis he did not think that Murphy's dicta regarding symptoms had been improved upon These were abdominal pain of abrupt onset nausea or vomiting abdominal sensitiveness settling in the region of the appendix and rise in temperature Any variations in the order of these symptoms caused Murphy to question the diagnosis The omissions from Murphy's list were he thought significant Indiscriminate diagnosis was the great fault Too commonly such a thing as abdominal influenza was diagnosed Rutherford Morison had put forward a statement that if pain in the abdomen required morphine the case was a surgical one and must be thought of in terms of operation The time for operation apart from very few exceptions was as soon as the diagnosis was made With regard to cases apparently subsiding it was not good practice to delay unless all the symptoms were subsiding spontaneously He believed in doing an operation which was essentially local and this was best performed through Rutherford Morison's muscle cutting incision parallel to Poupart's ligament Professor Grey Turner concluded by quoting Murphy's dictum that early operation was the only safe practice

Mr R J MCNEILL LOVE confined his contribution to the discussion to cases which presented themselves with an appendix mass For these he advocated delayed treatment because of the difficulty of operation and of the breaking down of adhesions which were limiting infection The procedure was the adoption of the Fowler position the application of fomentations and the maintenance of a constant watch on the pulse temperature and changes in the character of the mass Whereas previously a limited amount of fluid used to be given by the mouth this had been discontinued because of the relaxation of the ileo-caecal valve so caused with consequent local peristalsis Instead the patient had saline and glucose administered to him by continuous intravenous infusion Expectant treatment was not suitable for children or the aged—in the former because of the difficulty of obtaining a satisfactory history and because frequently the mother had administered a purgative in the latter because of the common rapid development of gangrene The results of expectant treatment were that in 65 per cent resolution occurred and a clean operation could be performed three months later in about 25 per cent of cases an abscess formed which might require drainage but might be absorbed in about 10 per cent of cases operation became imperative because of increased severity of the symptoms He denied that complications were more frequent with delayed treatment and thought that, whereas the probable mortality in these cases was about 6 per cent if immediate operation was performed it was only 3 per cent if expectant treatment was employed He agreed however that experienced surgeons had produced as low figures as the latter by immediate operation but maintained that most cases were operated upon by the less experienced

Mr H C W NUTTALL (Liverpool) said that much of the difficulty in such a discussion was the lack of uniformity in classification so that similar series could be compared He suggested a classification first into the unperforated the perforated and the complicated The unperforated he further subdivided into the non obstructed and the obstructed The perforated group might develop into localized peritonitis diffuse peritonitis or localized abscess In the complicated group he included only immediate complications due to direct spread of the infective process to neighbouring structures the most important being pylephlebitis ileus residual or subphrenic abscess and cellulitis of the abdominal wall He did not advocate delayed treatment although he thought that in exceptional circumstances and in inexperienced hands it had its place The amateur surgeon was out of place in either the immediate or the delayed treatment of acute appendicitis

Mr H H RAYNER (Manchester) said that despite the national mortality rates he thought there had been a striking improvement in results due to the realization of the value of early operation the use of the continuous intravenous drip of saline and glucose and the aspiration of the stomach contents when necessary through an indwelling catheter He emphasized the care necessary to remove an appendix on the point of rupture In cases with local peritonitis he was in favour of immediate operation except in the very fat the alcoholic and the patient with chronic bronchitis and

emphysema In these the risk of operation was greater than the risk of waiting for spontaneous subsidence Where there was a local lump which appeared to be more in the nature of inflammatory infiltration rather than an abscess he favoured delay, provided the patient was placed under proper hospital conditions

Mr W SAMPSON HANDLEY thought that practically all cases of acute appendicitis were of the obstructive type, and that for twelve to forty eight hours the inflammation was limited to the appendix Removal during this period left an "aseptic patient" In cases in which the appendix had ruptured a trickle of pus often escaped into the pelvis, and to meet this danger in late cases he advocated an initial small suprapubic incision to pass down a diagnostic swab

Mr H H BROWN (Worthing) referred to the occurrence of septicaemia in some cases operated upon after the first forty-eight hours There was, he considered, a negative phase about the third to the fifth day in which operation might induce a septicaemia In these cases no sign of local infection was found post mortem

Mr VICTOR HURLEY (Melbourne) said that it was a disappointing fact that in Australia as well as in England and the U S A the mortality from acute appendicitis was still rising The practice in Melbourne was immediate operation except in occasional bad risks, and he agreed with Mr Rayner on the subject of obese patients He thought the most dangerous cases were those of pelvic appendicitis, both from the diagnostic and operative points of view

Mr HERBERT CAIGLR (Sheffield) endorsed a previous speaker's plea for not attempting removal of the appendix where such removal appeared difficult

Mr W MCADAM ECCLES described how in three generations, of which he was the senior, prompt and immediate operation had been employed with success

Mr H C RUTHERFORD DARLING (Sydney, New South Wales) doubted if the obstructive type of appendicitis was so common as supposed He also thought it often impossible to determine the position and state of the appendix from clinical examination With regard to expectant treatment he thought that resolution did not necessarily occur in cases which subsided He had twice performed late operations for cases so treated, only to find dense adhesions and the stump of an appendix

Mr HAROLD DODD analysed five deaths in the past five years Two patients died from bronchopneumonia Both had had a common cold recently One had died from pylephlebitis Two had died from ileus, and he deprecated any active treatment in this complication

Professor GREY TURNER, in reply, said he did not object to expectant treatment in experienced and competent hands But there was a great danger, if the practice was widely preached and advocated, of an increased mortality The trouble was that the inexperienced frequently stretched the possibilities of a method far beyond what had originally been advocated

Mr A M BOYD read a short paper on arteriography

Wednesday July 20

Occipito-posterior Positions of the Vertex

Professor J CHASSAR MOIR (Oxford) opening a discussion on occipito posterior positions of the vertex and their complications, said that most posteriorly placed occiputs rotated to the front during labour, and a spontaneous delivery was the rule rather than the exception About one third of cases of failed forceps were associated with undiagnosed occipito-posterior cases The real cause of the difficulty in delivery was, he believed, a simple one, and was essentially a mal-adjustment of the shape of the foetus to the shape of the birth canal Face to pubes' was a common method of spontaneous delivery and occurred when the mother's pelvis was large and the foetus small But this was not an argument in favour of delivering occipito posterior cases in the face to pubes position it was much easier to rotate the occiput to the front Recent radiological investigations by Thoms and Caldwell, Moloy, and D Esopo had thrown new light on the mechanics of labour They had suggested that in some cases an occipito posterior case might be more easily delivered as a face to pubes case The actual causes of a persistent occipito posterior position were a large pelvis, a small foetus, and a deficient perineum Increased pelvic inclination and an extended foetal head favoured a posterior lie while minor degrees of pelvic contraction and abnormalities of uterine action were also complicating factors The foetal mortality in non rotated cases was high Forceps were apt to slip and damage the child's brain, and a gross damage to the pelvic floor was easily sustained The foetal mortality in neglected cases might be as high as 25 per cent In the diagnosis of occipito posterior position the presence of short ineffectual and severe pains with no advance should be regarded with suspicion

Professor J M MUNRO KERR (Canterbury) said the commonest diameter in which the foetus engaged was the transverse diameter of the pelvis—that is, the occiput lay L O T or R O T If the occiput was directed further posteriorly then a primary posterior position resulted, more commonly the occiput did not rotate backwards until the onset of labour, giving rise to a secondary posterior position Oxley had shown that in 90 per cent of such cases spontaneous rotation and delivery would occur Of these about 10 per cent were delivered face to pubes The foetal mortality was about 1 2 per cent In large maternity hospitals there was a high percentage of spontaneous deliveries with a low foetal mortality in cases from the district, but in in patient departments where early interference was undertaken the foetal mortality rose sharply

Professor FARQUHAR MURRAY (Newcastle) advised the correction of occipito posterior positions of the vertex during the later weeks of pregnancy by means of a pad and binder He always delivered such cases in the "cross bed" position, as it made the recognition of the obliquity of the head in relation to the outlet much easier Foetal distress with a still incompletely dilated cervix required very careful extraction past the cervix and a rapid delivery after an episiotomy at the outlet, owing to the possibility of the cord being round the neck Mr BRYAN WILLIAMS (Liverpool) considered that many of the so called persistent occipito posterior positions were in reality cases of 'transverse arrest of the head" He considered that this complication was imperfectly recognized and taught in this country, and that it presented far more difficulties than the occipito posterior position Out of 3 004 deliveries in the Walton Hospital the previous year there were fifty-three cases of persistent occipito-posterior position Spontaneous delivery occurred in forty one of these, and intervention was required in twelve, with no foetal or maternal mortality There were forty eight cases in which intervention was necessary for a transversely arrested head, the maternal morbidity rate being 27 per cent and the foetal mortality 27 per cent In deep transverse arrest manual rotation was difficult or impossible, and the application of forceps to the unrotated head led to a high foetal mortality Kjellard's forceps, in the hands of the expert, were of great help in such cases The use of intrapartum radiology should be widely extended

Mr L CARNAC RIVETT emphasized the necessity for early diagnosis in non rotation of the head Frequent vaginal examinations should be made, and the head rotated as soon as possible Professor J PRESTON MAXWELL (Pekin) stated that most cases could be rotated and easily delivered He also stressed the importance of measuring the outlet in all cases Mr JAMES W G H RIDDELL (Plymouth) recalled the important fact that pains in occipito posterior positions were severe early in labour It was no use encouraging the patient to bear down too early Internal version described by Smellie, was occasionally necessary Professor F J BROWNE recounted the original description of rotation by Smellie He emphasized the need for deep anaesthesia thorough "ironing" out of the vagina with plenty of lubricant, and the insertion of the whole hand in the vagina

SECTION OF NEUROLOGY AND PSYCHOLOGICAL MEDICINE

Wednesday July 20

Angiography

With the President Mr GEOFFREY JEFFERSON in the chair Professor HERBERT OLIVECRONA (Stockholm) in a paper on angiography said that the risks of this procedure must be considered in determining the indications for it He would not examine the possibility of a delayed radio active effect of retained thorium dioxide the amount injected was probably too small for this and speculation in the absence of clinical or pathological material was idle There were two other undesirable effects of angiography One was the development of thrombopenia pointed out some time ago by Lohr which might be complicated by oedema of the glottis This was of minor importance because with proper care there need be no such sequel If the thrombopenia was marked a blood transfusion should be given A more serious effect was the plugging of small vessels by thorotrast demonstrated by Nordmann (1936) and by Northfield and Russell (1937) Their observations had been amply confirmed by Ekstrom and Lindgren in the speaker's clinic This injury had been the main cause of death in two or three cases and possibly a contributory factor in some of the others In the light of this knowledge it was necessary to revise our attitude towards arteriography and Professor Olivecrona agreed that it should be used only where information necessary for treatment could not be obtained by other means It should be limited to cases where specific information on the condition of the cerebral blood vessels was required such as aneurysms In dealing with arterio venous aneurysms it might be preferable to perform an exploratory craniotomy if the evidence in favour of aneurysm was equivocal Other indications for arteriography lay in the diagnosis of glioblastoma and in those rare cases where localization was impossible and ventriculography had been unsuccessful He stressed the importance of limiting the amount of thorotrast by every precaution Only where strictly necessary should there be exposure in more than one plane and bilateral injections

Mr NORMAN DOTT (Edinburgh) considered that arteriography was of special service in studying lesions of the blood vessels especially congenital aneurysms of the larger cerebral arteries Such aneurysms might act as tumours by compressing adjacent structures or might make their presence felt by leakage or frank rupture It was in the latter that angiography was of special value for there was usually no other means of precise localization From his experience Mr Dott advocated expectant measures consisting of rest and the maintenance of a low blood pressure in patients over 50 years In younger patients angiography followed by ligation of the internal carotid artery or local treatment of the aneurysm according to its site was preferred In such cases angiography would show the degree of patency of the aneurysmal sac its exact site and relation to the arterial tree and the state of the local cerebral circulation Mr Dott emphasized the importance of the last point since ligation of the carotid artery in the presence of an impaired circulation might lead to an extensive softening and was therefore contra indicated Proceeding on these lines he had performed fourteen carotid ligations since 1933 with only one fatality that could be attributed to the operation

Mr D W C NORTHFIELD endorsed Professor Olivecrona's plea for caution in the use of thorotrast, and described certain clinical and histological sequels when thorotrast caused blockage of the small vessels about a compressing lesion of the brain Because of these sequels he now restricted the use of thorotrast to cases where the regional and pathological diagnosis could not otherwise be established and to clinch the diagnosis of spongioblastoma multiforme He considered with Mr Dott that angiography was most clearly indicated in cases of cerebral aneurysm and vascular malformations Dr HARDMAN (Manchester) in a series of lantern slides demonstrated peculiarities in the angio architecture of certain tumours of the brain The vessels were visualized in post mortem specimens either by injection of barium gelatin or by Pickworth's benzidine method By these techniques a characteristic vascular architecture had been demonstrated in three types of tumour spongioblastoma multiforme astrocytoma and meningioma The existence of numerous large venous sinusoids was a striking feature of spongioblastoma multiforme but no arterio venous anastomoses could be demonstrated

Mr JEFFERSON agreed that in border line cases of arterio venous aneurysm it might be advisable to perform a craniotomy first for diagnostic purposes and to define the extent of the lesion later by arteriography

Spasmodic Torticollis

In a paper on spasmodic torticollis Professor OLIVECRONA pointed out that in most cases the aetiology was obscure Opportunities for examination at necropsy were rare The association of the condition with epidemic encephalitis and Parkinsonism had among other observations supported the view that the essential lesion was extrapyramidal in situation Although spontaneous remissions sometimes lasting for years might occur the disability was often so great that patients insisted upon some form of treatment Medical treatment both with atropine and by the cultivation of an antagonistic gesture was sometimes effective in the milder types If such measures failed surgical intervention should be attempted Since operations aimed at the paralysis of those muscles which contracted during the spasm it was necessary accurately to assess the muscles involved and to plan accordingly Out of thirty three cases four showed slight symptoms and were treated medically In five the spinal accessory nerve was divided with complete or nearly complete relief In another the three upper cervical sensory root were divided on one side with nearly complete relief In the remaining twenty three cases division of the upper cervical motor roots was combined with peripheral division of one or occasionally of both spinal accessory nerves In two third of this group the patients were completely or almost completely relieved of spasm and were able to work they showed fair compensation towards the effects of the operation and the early instability of the head gradually disappeared some stiffness of the neck persisted In the remaining third the results were unsatisfactory either because the general condition of the patient was poor or because there were other ailments In some the spasm had extended into adjacent muscle groups or a major extrapyramidal syndrome had developed These patients were therefore incapacitated from some cause outside the scope of the operation

Dr MACDONALD CRITCHLEY divided cases of spasmodic torticollis into four types (1) purely psychogenic a variety of tic (2) following epidemic encephalitis in this the torticollis might be transitory (3) forming part of a more wide spread extrapyramidal motility disorder such as chronic progressive chorea bilateral athetosis etc and (4) a slowly progressive tonic clonic spasm not confined to the neck muscles The last group was the commonest and he regarded such cases as intractable Investigation often showed an occupational background and possibly a psychogenic basis He was sceptical about the surgical treatment of the condition largely because it appeared unscientific A more rational approach might lie in the operative ablation of cerebral cortex on the lines of the newer technique for the relief of hemi athetosis

Dr H V DICKS supported Dr Critchley in his pessimistic outlook He admitted an organic basis in spasmodic torticollis but felt that a functional element was also present in the sense in which psychologists spoke of purposiveness

Professor HENRY COHEN regarded Dr Critchley's classification of torticollis as a useful clinical basis The psychogenic cases were more commonly seen in the young the movement was purposive in origin and this type of case was usually amenable to psychotherapy There were three features of chronic encephalitic torticollis which merited comment first

its extreme rarity, secondly, its transitory character, and, thirdly the torticollis was part of a more general dystonia and might be preceded or followed by Parkinsonism The natural history of the fourth group was fairly constant The patient was usually over 40 years of age and showed a unilateral tonic clonic torticollis sometimes with bilateral retronuchal involvement Occupation, ocular muscle imbalance, psychopathic tendencies, and other factors might play a predisposing part, but treatment directed solely to these produced at best only partial and temporary alleviation In selected cases operation at this stage, though purely palliative, was a most helpful measure

Dr DOROTHY RUSSELL recorded the accidental experimental production of torticollis in a monkey This had followed an intracardiac injection made by a colleague The animal's brain, examined about eighteen months later, showed a symmetrical butterfly shaped area of softening in the subthalamic region which histologically appeared to be an infarct Dr F R FERGUSON (Manchester) recognized the psychological element in spasmodic torticollis, and agreed with Professor Cohen that a distinct type could be recognized in the elderly He did not, however, agree that the spasm in these patients was confined to the neck He advocated a combination of physiotherapy and surgical treatment until the part played by organic and psychogenic factors could be more clearly defined

Mr JEFFERSON in a warm tribute to Professor Olivecrona, urged that the organic background of this neglected disorder should be more fully explored, and that the surgical treatment should be taken up more vigorously in this country

COMBINED SECTIONS OF NEUROLOGY AND ORTHOPAEDICS

Wednesday July 20

Sciatica

After the chair had been taken by Mr GEOFFREY JEFFERSON (Manchester) President of the Section of Neurology and Psychological Medicine, Dr WILFRED J HARRIS opened a discussion on sciatica Dr Harris, in a general review of the subject, said that sciatica might be of the high type, in which case the lesion was above the level of the sciatic notch, or low, when the lesion was at or below the level of the notch In the first group the possibility of skeletal changes must always be borne in mind—conditions such as congenital abnormalities of the spine, new growths, or inflammatory lesions such as tuberculosis, and, lastly, hernia of the nucleus pulposus The spinal cord or nerve roots might be the site of a neoplastic or inflammatory process, requiring investigation as in cases in which the lesion was at a higher level Low sciatica was more difficult to elucidate, for after such well defined causes of neuritis as lead poisoning or diabetes were excluded (or more rarely found) cases remained in which chill, slight trauma, or focal sepsis were the only detectable factors, and a considerable residue in which the nerve pain had to be labelled "idiopathic' The truth was that there were still unpleasantly big gaps in our knowledge of the aetiology of sciatica

Professor JOSEPH S BARR (Boston, Mass, U S A) described only one type of sciatica—that resulting from compression of a nerve root by a prolapsed intervertebral disk, or hernia of the nucleus pulposus Although this lesion was found in only a minority of the cases it was of great interest as being the most recent and well defined addition to our knowledge of sciatica Though lesions of the intervertebral disks had been described in such admirable detail by Schmorl, he was not aware that posterior protrusions could be of clinical significance In brief, he noted merely that more or less posterior protrusion was present in about 15 per cent of spines examined post mortem Although a displaced disk might rarely produce complete paraplegia the typical syndrome was a sciatica with astonishingly few clinical signs referable to the nervous system The crucial finding in localizing the compression was a constant filling defect opposite one of the lower lumbar intervertebral disks in the radiographic picture obtained after the injection of 5 c.cm of lipiodol into the spinal theca Operative removal of the mass was usually indicated, and laminectomy with removal of the hernia had been performed in eighty three cases seen at the Massachusetts General Hospital The results were most satisfactory

Professor HENRY COHEN (Liverpool) discussed the common type of sciatica in which 'rheumatism' was the only obvious cause—a lesion allied to fibrositis He invited consideration of four points which had a direct bearing on the problem First, that nerves and muscles had a fascial covering which contained a small space lined with mesothelium this allowed gliding movements to occur, and, as in joints, interference with movement and pain would result if the space contained adhesions Secondly, an inflammatory focus in the soft parts of the lumbar region frequently caused pain referred along the course of the sciatic nerve injection of the affected area with a local anaesthetic abolished not only the local pain and tenderness but also the secondary sciatica Thirdly, the peri articular areas of the lumbar region were supplied by nerve filaments arising from the fourth and fifth lumbar and first sacral nerves Fourthly, there was a rich lymphatic anastomosis in the lumbar region which enveloped nerves as well as muscles a localized infection might therefore rapidly become widespread In a series of 420 private cases of sciatica he had found that most of his patients recovered completely within a relatively short period they behaved as if they were suffering from an inflammatory lesion which ran a fairly well defined course In the early days rest in bed and sedatives were essential If recovery did not follow within five or six weeks, persistent pain was due either to the presence of adhesions or to a major lesion which at first had not been apparent As with joints the presence of adhesions called for treatment designed to break them down Manipulation and the epidural injection of saline solution were two ways of accomplishing this He favoured epidural injection and employed 2 per cent (hypertonic) saline solution, which had the effect of disturbing intraneural relations so tending to break up scar tissue within the nerve trunks

Dr MACDONALD CRITCHLEY described various causes of sciatica none of them common but all of importance He described cases in which minor traumata or abnormality of posture were followed by sciatica commercial travellers driving for hours in small motor cars with badly sprung seats, the front rims of which pressed into the back of the thigh, miners sitting tailor fashion in low galleries, and an artists model who was required to sit for long periods in an unaccustomed attitude Damage to the sciatic trunks during the course of a protracted labour was a well known entity, and it was often found that the lateral (external popliteal) division was the more liable to suffer This was due to the lateral division being compressed against the ischium, whereas the medial division rested on the less resistant pyriformis muscle Sciatica might also result from varicosity of the veins draining the nerve trunk The presence of varices in the legs of a patient with sciatica was always suggestive though varicosity of the veins of the nerve might occur as an isolated lesion Sometimes the varices could be felt as a soft mass when the patient was examined in the erect position

Dr FERGUS R FERGUSON (Manchester) distinguished three types of sciatica neuritic, neoplastic and nuclear It had surprised him to find that the neoplastic type was often characterized by a sudden onset He emphasized the importance of lumbar puncture and determination of the protein content of the cerebrospinal fluid The presence of a tumour was suggested by finding xanthochromia, an increase in the protein content, and absence of manometric changes when the jugular veins were compressed Such findings should lead to localization of the block by the injection of lipiodol At the same time it must be remembered that an increase in the protein content of the cerebrospinal fluid was often found in the neuritic type The PRESIDENT, who had operated on two

cases of neurofibroma causing sciatica in the series of cases reported by Dr Ferguson said that this type of tumour was easily missed To overlook a growth of this type was all the more unfortunate seeing that surgical removal so often resulted in a complete cure

Most of Dr HUGH G GARLAND'S (Leeds) cases of idiopathic sciatica had been dealt with by epidural injection of saline solution He felt that it was the volume rather than the nature of the fluid that mattered and there was little to choose between 0 5 per cent novocain and normal saline solution He reported thirty seven cases in which fifty two injections had been given Immediate and noteworthy improvement often amounting to complete relief was seen in 80 per cent In the remaining cases further injections had been given but the results were discouraging In other words if a first injection failed it was unlikely that a later one would succeed The only complication he had seen occurred in four cases in which after the injection of about 50 c cm of fluid (he usually injected 60 to 160 c cm) the patient went into an epileptiform convulsion losing consciousness for a few seconds He attributed this to a sudden rise in intracranial pressure fortunately no lasting ill effects had been observed

Chill as a cause of sciatica had never appealed to Dr J B MENNELL There were records of people being chilled on a very large scale—as when the *Titanic* went down—yet nothing had been heard of sciatica among the survivors although they had been exposed to cold for many hours scantily clad and sitting on hard seats His experience had led him to pay great attention to focal sepsis

SECTION OF RADIOLOGY

Wednesday July 20

X Rays and Haemoptysis

With Dr R BOULTON MYLES in the chair Dr F G WOOD opened a discussion on x rays in the elucidation of haemoptysis Dr Wood's paper is published in this issue at page 211

Dr W E LLOYD speaking particularly of tuberculosis said that haemoptysis could occur at any stage in the disease and there were many cases in which it was the first symptom Patients rarely ignored this symptom and this gave the doctor opportunities of diagnosing very early cases in which physical signs were absent It was well known that in the days before accurate radiography the patients in such cases who had had sanatorium treatment at once became well and remained well Clinicians now had the added advantage of accurate radiological investigation The earliest radiographical evidence of tuberculosis in Dr Lloyd's experience was an apical area of infiltration with or without evidence of incipient cavitation Tomography should be helpful here Reliance on radiographic appearance alone was only justifiable when a single cavity was demonstrable When the appearance was doubtful further radiographs should be taken after a month at the end of which period cases of so called pulmonitis would have cleared up whereas a tuberculous focus would remain Frequent sputum examinations were a valuable aid to diagnosis but in some cases of haemoptysis due to tuberculosis there was no sputum Basal infiltration always suggested bronchiectasis and this could be confirmed by lipiodol but basal tuberculosis was not so uncommon as it was once thought to be In more advanced cases where the clinical diagnosis was simple radiography indicated the extent of the disease Haemoptysis occurred in fibroid pulmonary tuberculosis where the condition was clinically inactive the physical signs were those of chronic bronchitis and emphysema Radiological investigation revealed the true nature of the disease Sometimes there was collapse of the lung, usually when the haemoptysis was profuse Aspiration of blood might alter the radiographic picture temporarily

Dr S WHATELY DAVIDSON (Newcastle-on Tyne) said that with the development of thoracic surgery it was essential to obtain evidence of active disease in the lung and of the progress of the disease after operation The difficulties were due to the thoracic bony structures pathological changes round the lesion lipiodol residues and operative procedures such as thoracoplasty and plombage Much information could be gained by ordinary radiographic methods but such information was often not enough for the thoracic surgeon Indiscriminate use of lipiodol was to be deprecated on account of the residues which might take months to disappear and might therefore prevent successful re-examination and observation of progress The tomographic method was essential in selected cases and might obviate the necessity for lipiodol Twining of Manchester had placed it within the reach of British radiologists It was possible by this method to locate filling defects in bronchi and to demonstrate cavities which remain uncollapsed after procedures such as thoracoplasty and plombage The follow up of cases by radiography was important and was a means of encouraging collaboration between clinician and radiologist

Dr E L RUBIN (Liverpool) discussing haemoptysis with special reference to cardiovascular disease said that radiography was of greater value in excluding lung disease than in establishing the presence of heart disease but that it might be very helpful in the latter condition The commonest cause of haemoptysis in heart disease was mitral stenosis If there was undue prominence of the middle arc on the left border of the heart in a case of haemoptysis oblique views should be taken in order to demonstrate or exclude enlargement of the left auricle Haemoptysis might happen in early cases with little structural change while in cases with marked enlargement of both auricles this symptom might be absent In congenital heart disease haemoptysis was commonly the result of superimposed pulmonary tuberculosis but it did arise even in cases where there was complete stenosis of the pulmonary artery and no patent ductus arteriosus The blood supply to the lung in such cases came via the bronchial arteries which were enlarged and atheromatous Haemoptysis occurred occasionally in cases of hypertension and x ray examination might be the only means of demonstrating the previous presence of high blood pressure Radiographs showed elongation and tortuosity of the thoracic aorta and sometimes tortuosity of the oesophagus Aneurysm was a cause of haemoptysis which might also result from pulmonary arteriosclerosis Infarction of the lung was not often seen radiographically Massive infarction was rapidly fatal and small infarctions produced the appearance of localized collapse—they could not be diagnosed radiologically unless the clinical evidence suggested their presence Haemoptysis might arise from congestive changes in the lungs due to heart failure but the radiographic appearances were subject to wide variation and might simulate metastatic carcinoma or pulmonary tuberculosis

Dr E C WYNNE EDWARDS (Mundesley) discussing the occurrence of haemoptysis in known cases of pulmonary tuberculosis stressed the importance of radiographs in the lateral and oblique positions in addition to the antero-posterior position and drew attention to the need for tomography in some cases It was important in a given case to decide whether haemoptysis was a cause or only a symptom of a spread of disease There were certain cases in which there was recurrent haemoptysis without obvious deterioration in the condition of the lung or in the general health There were however two other types in which a radiograph following a haemoptysis showed a fresh area of disease In one this area had really been present before the haemoptysis and was often excavated in whole or in part In the other the lesion was fluffy in outline and was usually in the lower lobe It might be a true tuberculous extension or an area of pneumonitis due to aspiration of blood Subsequent radiological investigation would establish the diagnosis because the latter condition would clear up after a time A third type was that in which there was collapse of a whole or part of a lobe due to bronchial blockage by blood clot The differential diagnosis in such a case was important

because the patients required different treatment He would like to know whether radiologists had any method of deciding in a given case to which of these causes spread was due

Dr E J E TOPHAM drew attention to new growth of the lung as a cause of haemoptysis and quoted two cases in which it had been the first symptom Referring to a statement by Dr Lloyd, he said he doubted whether a radiologist was justified in diagnosing pulmonary tuberculosis on radiographic appearances alone

Dr P KERLEY said that he had seen cases in which haemoptysis was the first symptom of an abscess in the lung The radiographic appearance of blood in the lungs was important from a diagnostic point of view Inhaled blood gave the appearance of incompletely resolved lipiodol The best radiographs he had seen were taken with a rotating anode tube Dr Kerley quoted a rare case of recurrent haemoptysis in which the radiographic appearances were those of inhaled blood There were no indications of other disease and the abnormal radiographic appearances disappeared soon after each haemoptysis Bronchoscopy revealed a haemangioma of the trachea

The CHAIRMAN stressed the importance of close collaboration between clinician and radiologist without which it was impossible for the radiologist to get the best results It was important that radiologists should have more opportunities of following up cases

Dr WOOD in reply said that the orthodox view had always been that the left auricle formed no part of the left cardiac border This was based on post-mortem appearances which were obviously misleading Kymography revealed different wave forms in different parts of the heart, and recent papers by Stumpf and by Bordet on kymography confirmed the fact that the left auricle formed part of the lateral border

SECTION OF PHARMACOLOGY

Wednesday July 20

History of Anaesthetics

At the opening meeting of the Section of Pharmacology, Therapeutics and Anaesthetics, the President Professor A J CLARK (Edinburgh), gave an address on certain aspects of the history of anaesthetics

Professor Clark said that this subject had a unique interest for the pharmacologist because anaesthetic agents were the first synthetic organic chemical products employed to produce a therapeutic effect of major importance The discovery of the pharmacological action of nitrous oxide was of special local interest, because Sir Humphry Davy, born in Penzance, published in 1800 his *Researches Concerning Nitrous Oxide*, in which it was suggested that the gas could be used with advantage during certain surgical operations This prophecy, however, was forgotten, and it was not fulfilled until forty years later Professor Clark surveyed the early work of Hickman in connexion with carbon dioxide and the early use of nitrous oxide by Wells The news of Morton's successful employment of ether in 1846 quickly reached this country and created considerable interest in anaesthesia, which led to the discovery of the anaesthetic properties of chloroform by Simpson in 1847 For the next fifteen years many other drugs were investigated, only to be discarded in favour of the original three agents—nitrous oxide, ether, and chloroform, not until 1923 were there further appreciable advances in this subject He believed that further progress in anaesthesia was only likely to be made by co-ordinated work and by carefully organized large scale trials of new agents He regretted that, while this country was a pioneer in the investigation of problems in the early days of anaesthesia, recent advances had been made mainly abroad

The President then exhibited a cinematograph film showing individual variations in the effect of sodium evipan upon mice

Variations in Effective Anaesthetic Doses

Opening a discussion on variations in effective anaesthetic doses Dr J W TREVAN described a series of experiments in which mice were subjected to intravenous injection of paraldehyde He showed that, owing to the overlap of the statistical distributions of the fatal and of the anaesthetic doses, no single dose, the administration of which would ensure that all mice were anaesthetized without killing more than one in 10,000, could be prescribed This could not be overcome by giving the dose in six fractions The only feasible method was slow continuous infusion of a dilute solution which was stopped when anaesthesia had reached the desired level Similar results had been obtained with sodium amytal, sodium evipan, and avertin

Dr C J M DAWKINS referred particularly to the effect of changes in the weather as a cause of individual anaesthetic response in the patient In a series of 675 dental cases he had found that induction time increased as the barometric pressure fell With relative humidity the lower the percentage the shorter was the induction time He had also investigated the connexion between the complexion of the patient and the induction period, and he found that, whereas the average time taken to produce anaesthesia in fair-haired patients was fifty two seconds, the figure for dark haired was sixty two seconds, and for red haired sixty eight

Spinal Anaesthesia

Professor A D MACDONALD (Manchester), referring to spinal anaesthesia, considered there was only one way in which a spinal injection of a local anaesthetic might kill an animal—namely, by respiratory depression and paralysis Provided the phrenic roots and respiratory centre were not exposed to paralysing concentrations of the drug, the anaesthetic seemed perfectly safe If adequate oxygenation was maintained it was extremely difficult to kill an animal with a local anaesthetic irrespective of the method of administration The principle of individual variation seemed to apply to those cases in which paralysis of tail, bladder, and rectum was observed after spinal anaesthesia He believed that this effect was provoked solely by the anaesthetic drug and he disregarded mechanical trauma and other constituents of the solution, such as dilute alcohol or glycerin, as possible causal agents

Basal Anaesthesia

Dr B P HILL (Reading), discussing basal narcotics said that cases showing hypersusceptibility were very rare when paraldehyde was employed More frequent susceptibility was observed with avertin and more information as to the cause and avoidance of symptoms was available He thought that the damage to the liver cell produced in certain cases indicated hypersusceptibility, and was due to deficiency of a substance which normally protected this organ from necrosis during detoxication of the drug Hypersusceptibility to barbiturates was inconstant even in the same individual Certain inconstant factors predisposed to an undue reaction after a normal dose There was no reliable test by which a hypersusceptible patient could be detected he had tried out a skin test which proved to be quite unreliable

The PRESIDENT asked if individual variation could be controlled by fractional dosage He believed that administration of a non-volatile anaesthetic in a dosage per kilogramme of body weight was unsafe In practice, however, susceptibility to paraldehyde per rectum was not such as might be expected from animal experiments Dr R K FOULKES (Exeter) inquired if liver extract should be given before the administration of chloroform and avertin in order to minimize the risk of toxic effects Dr O C CARTER (Bournemouth) had given 1,500 administrations of avertin without anxiety and had never observed damage to the liver cell He had used this drug for operations upon the gall bladder, and even when there was jaundice Dr B P HILL (Reading) quoted a case of damage to the liver following avertin in which severe headache, vomiting dehydration, and conjunctival icterus were marked features

Professor W P KENNEDY (Baghdad) stated that the depth and duration of avertin narcosis varied considerably in different patients and so the amount of supplementary anaesthetic necessary was a variable quantity He believed the amnesia produced by avertin to be a great advantage Mr W ETHERINGTON WILSON (Torquay) emphasized that a safe and well thought-out technique was important in helping to eliminate the various dangers of spinal analgesia He drew attention to the method of timed vertical ascent based upon mock spinal experiments This was a safe and simple method achieving real control It was he believed safe to administer spinocain by this technique and he described a small series of cases in which percaine 1 in 2 500 had been given to infants with satisfactory results

Ovarian Therapy

Dr P M F BISHOP in a paper on ovarian therapy stated that the oestrogens of which oestrone oestriol and oestradiol were available had a therapeutic effect when given by the mouth Intramuscular administration however was preferable and esterification of the hormone enhanced the effect The action of oestradiol benzoate administered in this fashion lasted for three days and the desire to increase further the interval between injections had led to the institution of crystalline tablet implantation With this method a small compressed tablet of crystalline oestradiol benzoate was introduced under the skin through a small incision by reason of the slow absorption there was a continuous constant effect over a period of time The oestrogens were of value in the treatment of true menopausal symptoms but he believed that even in large doses they were ineffective in conditions commonly thought to be associated with the menopause—for example menopausal arthritis

Wednesday July 20

Methods of Testing Colour Vision

Professor R J S MCDOWALL took the chair when the programme in this section was opened with a paper by the President Professor H E ROAF (Liverpool) on methods of testing for colour vision and theoretical deductions from observations on colour vision

Professor Roaf referred to the fact that in the spectrum there are two main maxima of colour discrimination corresponding to the sensations of yellow and blue green These two regions had been studied to determine whether the sharpness of discrimination was related to any special recognition of these colours when there was no fixed wave length with which to compare them The method of investigation using the spectroscope was illustrated first in respect of the yellow sensation the range being marked between extreme points where the subject saw the yellow to be just tinged with the neighbouring colours of the spectrum Figures obtained with respect to normals showed a narrower range of wave length—that is a higher power of discrimination—than for those with defective colour vision Similar studies in the blue green had led to the conclusion that subjects with defective colour vision had no special difficulty in distinguishing colours produced by this region Professor Roaf then went on to discuss the various methods in use for testing for defective colour vision mentioning first the fundamental lantern method In regard to the Nagel anomaloscope he cited evidence which suggested some systematic defect in this method Passing next to the use of pseudo isochromatic plates on which the normal person could see a design not visible to the subject with defective colour vision he considered Ishihara's plates as probably the best form and explained how they worked Finally he dealt with binocular colour fusion and instanced practical applications that might arise out of a study of this aspect of the subject

Professor MCDOWALL asked whether perception of any one colour was more acute than the rest Dr A SAND (Plymouth) raised the question of the mechanism of conveying colour to consciousness and also referred to colour perception in the lower animals Professor ROAF in reply illustrated the retinal cones with their different colour filters in birds which would explain a three colour vision Dr T S HELE (Cambridge) inquired whether there was any evidence of defective colour vision being associated with vitamin deficiency A number of interesting points were then raised by Dr W R G ATKINS (Plymouth) whether didymium glass would be of use in detecting defective colour vision how far colour vision was affected by fatigue and to what extent the owl was sensitive to infra red Dr L H N COOPER (Plymouth) drew attention to the desirability of testing the colour vision of chemical analysts who have to match colours accurately

Hearing in the Lower Animals

With the President Professor H E Roaf in the chair Dr A SAND (Plymouth) opened a discussion on hearing with special reference to the lower animals

Dr Sand stated that in fishes the organs of the lateral line had a histological structure almost identical with the hair cells of the organ of Corti and they arose in embryological development out of the same anlage as the eye so that one spoke of the acoustico lateral system which included the lateral line and labyrinthine organs By physiological experiments recording the active potentials from lateral line nerves it was found that lateral line receptors were exceedingly sensitive to vibrations of low frequency Moreover perfusion experiments showed that a constant deformation of the hair cell provided a slow adapting rhythmical response in single fibres Extending these conceptions to the organ of Corti one was led to recognize that the frequency of discharge was not determined by the intensity of the stimulus which was an alternating (or oscillating) mechanical change but was driven by the frequency of the stimulus up to the limit of frequency of which the nerve was capable There followed phenomena of alternation and equilibration which destroyed the direct connexion between the frequency of the sound stimulus and the frequency of the nerve impulse discharge They were thus led to the resonance or place theory of pitch discrimination and the interpretation of loudness in terms of the number of sensory elements excited Fishes had been shown to have excellent hearing and to be capable of discriminating pitch to within a minor third But fishes had no cochlea and so the resonance theory could not apply to them

Dr H C PURCER SMITH (Barnes) raised a question regarding high levels of intensity in relation to the sensation of pain while the PRESIDENT drew attention to the possible relation of intensity to the number of hair cells affected Dr SAND in reply stated that loudness was conveyed by the greater or less width of basilar membrane set in oscillation

In the afternoon the section attended the Marine Biological Station where a series of extremely interesting demonstrations were given by members of the staff and visiting members

SECTION OF PATHOLOGY, BACTERIOLOGY, AND IMMUNOLOGY

Wednesday July 20

Aetiology of Rheumatism

With the President Dr M H GORDON in the chair Dr H J GIBSON (Bath) opening a discussion on the aetiology of acute rheumatism and rheumatoid arthritis proposed first to discuss the phenomenon of throat infection with *Str haemolyticus* followed by a latent period which in turn was followed by an attack or relapse of acute rheumatism The epidemiological and serological findings taken together provided a mass of evidence in favour of the aetiological relationship of the haemolytic streptococcus to rheumatic fever Contrary evidence from sporadic cases not susceptible to bacteriological study in the pre rheumatic stages was less

convincing Two alternative theories appeared to fit the observed facts either the disease was an infection with *Str haemolyticus* or some other specific rheumatic agent was primary and the streptococcus merely one of a number of secondary inciting causes Direct evidence for the former theory was slight, though failure to find organisms was not conclusive evidence against a low-grade generalized infection Failure to find the organisms had led to the theory of allergy The acceptance of this presupposed that we knew that the pathogenic potentialities of the streptococcus were insufficient to explain how chronic infection with it could cause disease of the rheumatic type by ordinary means Such an assumption was unwarranted The allergic theory had, however, received support from recent histological and experimental studies, and the hyperergic reaction probably had a place, whatever the nature of the primary infecting agent, and was an important field of investigation that would certainly lead to a fuller understanding of the pathogenesis of the disease Therapeutic evidence of the effects of Dick toxin, passive immunization with serum, or administration of sulphanilamide did not support the streptococcal viewpoint or disprove it The alternative hypothesis of a specific rheumatic infective agent was an almost equally satisfactory explanation of the facts as we knew them, and there was much to be said in favour of it The relation between acute rheumatism and rheumatoid arthritis was a subject of much controversy Clinically there was little similarity, but on the pathological side there was evidence that the diseases might be related Haemolytic streptococci had been recovered from the blood and joint fluid in rheumatoid arthritis and these streptococci agglutinated with the patient's serum The agglutinins resembled the natural antibodies of normal sera more than immune agglutinins following infection or immunization

Dr G H EAGLES said that the possibility of a virus playing a part in the causation of rheumatism had been considered by several investigators Schlesinger, Signy, and Amies had shown in rheumatic exudates particles morphologically similar to those of known viruses which were specifically agglutinated by the sera of rheumatic patients in the active stage of the disease This investigation suggested that these particles were true elementary bodies and were the actual infective agent Eagles, Evans, Fisher, and Keith extended these observations Elementary bodies were obtained from acute rheumatic exudates, cerebrospinal fluid from chorea with carditis and nodules joint fluids from rheumatoid arthritis and, as a control, from non-rheumatic exudates Morphological examination did not suffice to differentiate between those of rheumatic origin and those of non rheumatic Morphological evidence alone was therefore insufficient Considerably greater significance attached to serological evidence gained by agglutination of these particles by patients sera The distribution of positive and negative agglutination was very similar to that observed with the preparations from cases of rheumatic fever, and suggested a common factor in the causation of rheumatic fever, rheumatoid arthritis, and chorea Adequate controls with non rheumatic suspensions suggested that positive results were confined to rheumatism Experiments had been made to establish the infectivity of these particles in monkeys In certain instances the clinical behaviour had suggested grave cardiac damage as a result of inoculation These, along with some abnormalities in electrocardiographic records, were suggestive, but had not been supported by pathological findings He emphasized the need for adequate infection experiments with any supposed elementary bodies before these could be accepted as the aetiological agent

Dr D H COLLINS (Harrogate) said that no one of the pathological phenomena of rheumatism or rheumatoid arthritis was specific to the disease in question Experimental production of various connective tissue changes should not be too readily accepted as having direct bearing on the problem of rheumatism The ultimate aim of experimental work must be to produce rheumatic disease rather than microscopical appearances In view of the fact that so many of the pathological data were of doubtful specificity and that the clinical differences between rheumatic fever and rheumatoid arthritis were so pronounced it was better to regard these two diseases as independent The histologist could see in rheumatic fever phenomena which indicated widespread damage throughout the body, caused either by an infective agent or by its soluble products, together with phenomena resulting from tissue hypersensitivity produced as a phase of the infection These changes might be followed at any time by the non specific processes of repair In rheumatoid arthritis the disease was more clearly localized to the joints and to the subcutaneous tissues which were exposed to trauma Bacteriological researches in both forms of rheumatism seemed to incriminate the streptococcus The histological findings, though unlike those of any hitherto proved streptococcal disease, did not weigh against the possibility of a streptococcal aetiology, since the protean capabilities of the streptococcus in pathogenesis were only just beginning to be explored

Dr C A GREEN (Edinburgh) said that in a group of 200 subjects acute or subacute rheumatic manifestations had been found to be preceded by nasopharyngeal infection in 78 per cent and in 58 per cent haemolytic streptococci were still present in the nasopharynx at the onset of the rheumatic syndrome A relatively high incidence of recent nasopharyngeal infection, 46 per cent was found in a control group, and haemolytic streptococci were found in 30 per cent Of the strains from the rheumatic group 87 per cent were of Group A, while only 42 per cent of the control strains were of this group Further indirect evidence of streptococcal infection in rheumatic persons was provided by their raised anti-haemolysin titres In the quiescent phase the subcutaneous injection of haemolytic streptococcal nucleoprotein might induce local reactions clinically indistinguishable from erythema nodosum and a general reaction simulating a naturally occurring recrudescence of the acute phase of illness As direct evidence of such infection cultures from heart valves with vegetations or from pericardial lesions had yielded haemolytic streptococci in nine out of ten consecutive cases of acute rheumatism examined post mortem Control cultures from healthy valves without vegetations from the same hearts and of heart blood were negative for haemolytic streptococci From six of these cases haemolytic streptococci had been recovered from the nasopharynx during life and in all instances these were serologically identical with those isolated post mortem Rabbits inoculated with post mortem pericardial fluid from rheumatic subjects died as a result of haemolytic streptococcal infection and showed a peculiar distribution of cocci in their tissues The same distribution could be recognized in tonsils infected with streptococci, and a similar appearance could be demonstrated in human heart valves with rheumatic vegetations

Dr E P POULTON said that, in collaboration with Dr Koerner, Gray-Hill and Todd he had observed high antistreptolysin titres in various conditions which had been hitherto regarded as associated with haemolytic streptococcal infection Apart from acute rheumatism erythema nodosum chorea and acute nephritis where a high titre had already been described, they had found high values in purpura whether the platelets were normal or reduced and in two cases where fever and glands following sore throats were the only symptoms He suggested that acute rheumatism might be a syndrome due to different exciting agencies The tubercle bacillus appeared to be the cause in one instance and the relation of the syndrome to the haemolytic streptococcus might be regarded as parallel to the relation of epituberculosis to the tubercle bacillus

Dr M H GORDON said that he himself had injected rabbits intravenously with a highly virulent virus isolated by rabbit testicle passage from a case of small pox These rabbits developed peri articular swellings from which the virus was recovered in greater concentration in the serofibrinous exudate than from the other organs Microscopically the lesions showed the same changes as had been seen in lesions of fibrositis in rheumatism Control experiments with normal horse serum, *Staphylococcus epidermidis Staphylococcus aureus* and *Bact coli* were negative Haemolytic streptococci however did produce arthritis He then tried the effect of mixing virus and streptococci In these experiments the streptococcus alone sometimes produced arthritis, the virus

alone never but the mixture always The streptococcus could never be subsequently isolated from the lesions but the virus was always present in great amount *In vitro* the virus had no inhibiting action on the streptococcus but when the mixture was inoculated intradermally the streptococcus again disappeared though the virus could be recovered from the skin lesions

Sir WILLIAM WILLCOX said that progress in our knowledge of this subject was due to recent advances in bacteriological technique Rheumatism was not a specific disease but a syndrome Fibrositis occurred in many other diseases such as gonorrhoea bacillary dysentery brucella infections etc He urged that investigations should be carried out on virgin soil—that is to say in primary attacks of rheumatism

SECTION OF TUBERCULOSIS

Wednesday July 20

Radiography of the Chest

With Dr ERNEST WARD President in the chair Dr GEORGE JESSEL (Leigh Lancs) opening a discussion on radiography of the chest said that even when pulmonary tuberculosis had been diagnosed radiography was often of much value particularly in treatment by artificial pneumothorax and in surgical procedures and in ascertaining the progress of the disease Caution must be exercised in interpreting radiographs because the x ray appearances of several chest conditions might at times be indistinguishable from each other

Dr G T HEBERT said that the radiological interpretation of fibrosis in the lungs had become more difficult since it had been shown that the lung markings were due to shadows caused not by the bronchi but by the vessels He classified fibrosis into (1) perifocal giving nodular shadows and caused by tuberculosis or silicosis (2) interstitial giving haziness or a ground glass appearance and frequently associated with emphysema and (3) peribronchial simulating congestion Dr Hebert described how thirty radiographs of patients he had fully investigated or whom he had been able to follow up long enough to be certain about the diagnosis were sent without clinical details to about seventy radiologists physicians and tuberculosis officers for an opinion as to whether fibrosis was present or not In regard to some films a correct diagnosis was given by 85 to 90 per cent of the examinees in regard to others an erroneous diagnosis was given by over 50 per cent From this investigation he concluded that it was difficult with certain exceptions to recognize fibrosis of the lungs from the radiographic appearances alone a diagnosis of fibrosis made in this way was usually based on inference rather than on shadows actually cast by fibrous tissue Contraction of the lung was good inferential evidence of fibrosis The earlier stages of the nodular form of silicosis might be simulated by several non fibrotic conditions One should beware of ascribing linear shadows to tuberculous fibrosis unless there was much nodular or confluent shadow in the neighbourhood and of regarding the wall of a circular or oval cavity as fibrous just because it was dense And above all one should beware of diagnosing general fibrosis when the pulmonary markings were merely more prominent or more streaky than usual

Dr W BURTON WOOD without minimizing the importance of the physical examination suggested that physical signs were almost useless in the diagnosis of pulmonary tuberculosis On the other hand radiology could not be relied on alone He deplored the use by some radiologists of the terms active and non active when they were based solely on radiographic appearances Several chest conditions could give similar appearances He expressed some doubts of the value claimed for tomography

The PRESIDENT emphasized that radiological examination was essential but some physicians were specially gifted in the elicitation of physical signs For contact cases an elaborate examination of the chest in addition was generally not necessary particularly as contacts were often much more likely to agree to having a radiograph taken All patients referred to the tuberculosis officer should be x rayed

Dr G GREGORY KAYNE (Staines) expressed surprise that no radiologist had been chosen to be one of the openers of the discussion even though all the three openers practised radiological examination of the chest This would help however to stress the fact that a knowledge of radiology was now an essential equipment of the tuberculosis physician But the radiologist was still required for consultation in difficult cases and for advice on any ancillary radiological examinations that should be carried out to elucidate a doubtful case—for example bronchography oblique films tomography etc He referred to taking films in vertical shift for the detection of small shadows behind the ribs The interpretation of tomograms might be misleading as demonstrated by a recently published case—the tomograms showed a whole system of cavities at necropsy shortly afterwards only one cavity was found Radiological examination was of the greatest value in the prevention of tuberculosis for it enabled the detection of minimal lesions in the apparently healthy Dr Hebert's investigation stressed the fact that skiagrams should not be interpreted in terms having a pathological connotation

Dr PETER W EDWARDS (Market Drayton) stressed the value of thorough screening The interpretation of tomograms was still uncertain but there was no doubt as to the value of the method Stereoscopic films were useful in the diagnosis of early cases and in locating foreign bodies In regard to cutting of adhesions radiology was of little value—one must insert a thoracoscope and look in He stressed the value of serial skiagrams both in diagnosis and in deciding treatment and referred to the confusion that might arise from shadows persisting after injection of lipiodol

Dr H T CHATFIELD (Plymouth) referred to the frequency of pulmonary tuberculosis among naval men from the China station as compared with those from other stations Dr A MCK FLEMING (Gibraltar) contributed some remarks on the recent organization of the anti tuberculosis campaign in Gibraltar Dr J R GILLESPIE (Belfast) recommended the use of the subcutaneous tuberculin test in diagnosis Dr D A POWELL (Cardiff) stressed the value of screening and the need for revision of the nomenclature in radiological interpretation of radiographs Dr SCOTT (London) speaking as a general practitioner defended the use of the stethoscope Dr H S HOWIE WOOD (Shanklin) suggested that radiologists with small but adequate plants should be allowed to take radiographs even if someone more expert was asked to interpret the films

SECTION OF OTO RHINO LARYNGOLOGY

Wednesday July 20

Malignant Disease of the Pharynx

Mr LIONEL COLLEDGE (the text of whose paper was published in the *Journal* of July 23 p 167) opening a discussion on the treatment of malignant disease of the pharynx and larynx and its results said that the problem of treatment had been complicated by the introduction of irradiation especially as in so many cases tumours which responded to this were those particularly amenable to ordinary surgical measures He divided the malignant growths into tumours of the oropharynx and of the laryngo pharynx confining the discussion to epitheliomata which were by far the commonest Unless he found by biopsy that the epithelioma was of group IV a particularly radio sensitive type he preferred surgical treatment In the oropharynx diathermy gave on the whole the best results While admitting that the functional result in surgical treatment of carcinomata of the laryngo-pharynx and larynx was not so universally good as in irradiation he said that the percentage of cures was so much higher in the former that it should always be the procedure of choice

Mr C HAMBLEN THOMAS in a paper on the treatment of such tumours by irradiation said that an operation when possible should be preferred to irradiation having regard

always to preservation or restoration of function The suitability or otherwise of a growth for treatment by irradiation depended upon its situation and the character of its cells The presence or absence of enlarged lymph glands also influenced the choice of treatment glandular metastases being highly resistant to irradiation In many cases irradiation could be a most useful preliminary to operation provided not more than about twenty five days elapsed between the two treatments On the whole he preferred radium needles to radon seeds and deep x rays to the radium bomb To ensure better results from irradiation all cases should be treated as in patients institutional accommodation for these people was at present hopelessly inadequate

MR E MUSGRAVE WOODMAN (Birmingham) said that he had gradually abandoned diathermy for the oropharyngeal growths in favour of irradiation Further he found better results from radium needles than from radon seeds In extrinsic carcinoma such as post cricoid growths one must not hesitate to sacrifice a healthy larynx if by such an operation one could save the patient's life

MR F C ORMEROD then showed lantern slides to illustrate the technique of treatment of carcinoma of the pharynx and larynx by the radium bomb together with radiographs illustrating the results of treatment of post-cricoid growths and metastases in the cervical glands

Injuries of the Nose

MR T POMFRET KILNER in discussing injuries of the nose stressed the importance of early and complete disimpaction and setting of all simple fractures He considered intratracheal anaesthesia and efficient blood suction apparatus essential for careful unhurried work and advocated the use of a simple splint of stent moulded over lead for one to two days after operation In fractures accompanied by external skin wounds he deprecated debridement there being insufficient skin in this particular region to allow of trimming of the edge of the wound without producing distortion A careful search should be made for foreign bodies in such wounds, and all glass and road metal fragments should be removed Fragments of wood were particularly apt to be overlooked Completely separated bone fragments should be removed and in the absence of infection an attempt should be made to manipulate displaced fragments into correct position The wound should be sutured accurately but loosely and a sharp watch should be kept for infection calling for early removal of sutures *Associated fractures—for example of the malar* bone—should be looked for and treated In cases in which there was loss of surface skin he advised early free skin-grafting to prevent distortion Where the loss involved all thicknesses he advocated careful mucous membrane to skin suture around the defect thus paving the way for future reconstruction

MR KILNER showed lantern slides illustrating various types of injury and the results of treatment of these by simple disimpaction and setting surgical refracture hump reduction shortening cartilage and bone grafting and reconstruction by forehead and other flaps

MR E WATSON WILLIAMS (Bristol) thought that simple fractures of the nose were the province of the nasal surgeon but was anxious to hear from Mr Kilner the best method of treating fractures involving backward displacement of both superior maxillae MR HAMBLEN THOMAS preferred to operate if possible within seven days of the injury He asked if Mr Kilner could guide him in the treatment of collapse of the alae nasi MR I SIMSON HALL (Edinburgh) asked whether cartilage or bone grafts were preferable MR GRIMWADE (Birmingham) asked if a chisel were preferable to a rasp for removing humps of the nasal bridge

MR KILNER in reply said he preferred cartilage to bone grafts being so much easier to mould and manipulate except in small children In the case of fractures he advocated immediate reduction and replacement the next best time was as soon as swelling had subsided but even as long as five weeks after the accident it was often possible to manipulate the fragments without refracture A chisel was preferred to a rasp as the latter left much bone dust He had not had cases of collapsed alae referred to him but thought that such cases would benefit by a shortening operation on the septum rather than by any plastic alar operation

Deflection of the Septum

MR W S SYME (Glasgow) opened a discussion on septal deflection He maintained that there were many reasons why a septal deflection tended to be blamed for more ills than it deserved and through this to be treated surgically more frequently than was actually necessary It was easy to diagnose, generally simple to treat surgically and such treatment did not usually cause extreme discomfort or lasting harm Deflection was reported as occurring in from 60 to 80 per cent. of Europeans with no ill effect and was stated by some to be commonly due to trauma by others seldom so Was it abnormal? Its most troublesome effect was the blocking of sinus drainage Nature made compensation for the difference in size of the two nasal cavities When was surgical intervention justified?

MR T RITCHIE RODGER (Hull) questioned whether there had been excessive operation on the septum in early days He thought that submucous resection still had a great sphere of usefulness both as a means of increasing the patient's comfort and to facilitate surgical approach to other nasal conditions requiring operation

SERVICES SECTION

Wednesday July 20

Evacuation and Treatment of Gas Casualties

With Surgeon Rear Admiral F J GOWANS (Plymouth) in the chair Major E H HALL R A M C (Porton) opened a discussion on the treatment and evacuation of gas casualties

Confining his remarks to the problem as it affected the R A M C officer who had to deal with gas casualties in the forward areas during actual warfare Major Hall pointed out that gas casualties in these areas were first dealt with by regimental stretcher bearers and brought to the regimental aid post Here those suffering from the effects of lachrimatory gases could be reassured and returned to their units Also at this post the diagnosis must be made between patients severely affected by sensory irritant gases and those less severely affected by lung irritant gases The former should be retained at the post until fit to return to their units but the latter must be regarded as stretcher cases and treated with rest and warmth and removed to the field ambulance as quickly as possible Vesicant gas cases would probably form the bulk of the gas casualties and for dealing with these Major Hall advocated the marking off at the aid post of a dirty area a decontamination area, and a clean area There should also be extra transport to provide supplies of clean clothing This would ensure that no cases were sent to the next medical unit not properly decontaminated Major Hall considered that in a war of rapid movement the provision of special units purely for dealing with gas casualties was impracticable At the field ambulance cases severely affected with lung irritants and with vesicants could have further treatment, such as the administration of oxygen and saline infusions before being removed to the casualty clearing station This unit should also have sub units with decontamination centres to deal with cases occurring in the immediate vicinity and medical personnel that might have become contaminated The gas proofing of advanced dressing stations was impracticable but if a main dressing station was situated in a building a room and operating theatre might be gas proofed for the reception of the seriously wounded who could not wear respirators At the casualty clearing station special wards might be set aside for the treatment of gas cases and oxygen administered simultaneously to several Here also simple decontamination centres might be necessary to deal with cases occurring in the area of the station but elaborate centres were probably not necessary Major Hall did not deal with cases arising at the base, as measures for

these were exactly similar to those for civilian populations and were given in the A R P handbook

Surgeon Captain E ST G S GOODWIN R N said that accurate assessment of the severity of cases and their treatment at advanced posts would save the time of medical officers and also much hospital work This applied especially to the sorting out of patients who only believed themselves to have been gassed The speaker also emphasized the importance of the recognition of the delayed action of some lung irritant gases He advocated that where possible special wards should be made for gas cases or at least that they should be segregated from the other patients for a time Methods for dealing with gas cases occurring at sea were in principle similar to those clearly explained by Major Hall

Colonel F R SANDFORD R A M C T A considered that special anti gas units should be formed to deal with the treatment and evacuation of gas casualties in forward areas These could be mobile and be moved quickly to the scene of any gas attack This would leave the field ambulances more free to deal with ordinary casualties

Squadron Leader C J S O'MALLEY R A F emphasized the importance of reassurance in dealing with gas cases He agreed with Colonel Sandford that anti gas units should be formed as only in this way could adequate training be provided He spoke of the difficulty of getting sufficient equipment for practical instruction in gas work in his own Service

Major HALL in reply held that segregation was not called for and that urgent treatment for wounds might require immediate admission to the acute surgical ward He also considered that special anti gas units besides being impracticable owing to the rapid movement of troops placed too much importance on the use of gas as a weapon of attack in modern warfare

SECTION OF DISEASES OF CHILDREN

Wednesday July 20

Breast Feeding

With Dr LINDSAY A DEY vice president (Sydney N S W) in the chair Dr J C SPENCE (Newcastle) in opening a discussion on the modern decline of breast feeding said that in the eighteenth century there were few women who did not either feed their babies or hire a wet nurse Now owing to the invention of the feeding bottle and the rubber teat the cow was the mother substitute With an infantile mortality rate twice as high as that in many other countries and about 20 000 preventable deaths each year among young infants, it was important to combat the tendency—shown even in the preventive medicine service—to deprecate the value of breast feeding Analysis of figures led to the conclusion that 20 to 30 per cent of babies were artificially fed from birth in most big towns and not more than one third of the mothers of these towns were fully feeding their babies until the sixth month Dr Spence stressed the likelihood of late evil effects in the adult who had been artificially fed in infancy The effect on the mother who cut short the reproductive cycle had also to be considered It was essential he continued to study closely the different stages in the full establishment of lactation and the large variations in the quantity and quality of breast milk Only 5 per cent of mothers who did not succeed in feeding their infants failed because of physical abnormalities The remainder either would not or did not know how to feed their infants on the breast Ignorance and selfishness were important factors and the fault often lay not so much in the mothers as in their advisers Mismanagement was the chief cause of the failure to establish lactation Better education of doctors and maternity nurses was among the most important ways of correcting this

Dr S J FOLLEY (National Institute for Research in Dairying) describing recent work on the endocrine control of lactation said it was probably true that in the development of the human breast the corpus luteum hormone was necessary as well as the oestrogenic hormones of the ovary and it was likely that mammary growth was induced indirectly by the action of oestrogens upon the pituitary causing this gland to secrete a mammogenic hormone The prolactin of the anterior pituitary activated the adequately developed mammary gland Crude extracts of this substance were more effective than refined preparations in initiating and maintaining lactation in hypophysectomized animals and this was explicable on the lines that the integrity of the adrenal cortex was essential for lactation the crude prolactin supplying this Administration of thyroid gland to cows in declining lactation stimulated secretion of milk It was possible that there was more than one lactogenic factor in the anterio pituitary

Dr AUDREY RUSSELL pointed out that clinical studies o the factors controlling lactation were complicated by the frequent spontaneous return of ovarian activity during lactation Investigation of the lactation and menstrual histories of a large group of mothers in St Pancras where the figures for successful breast feeding seemed to be about 5 per cent higher than those given by Dr Spence for the North of England indicated that there was a definite relation between amenorrhoea and successful lactation Although failure of lactation was possibly due to endocrinal changes in less than 10 per cent of women in fully 50 per cent the cause was mechanical inefficiency of suckling and emptying of the breast The maintenance of this secretory reflex was most important and Dr Russell described an ingenious method of introducing a catheter into the baby s mouth to give complementary feeds at the same time as breast feeding was going on in cases of insufficient secretion in order to encourage good suckling despite the poorly filled breasts

Dr ETHEL CASSIE (Birmingham) said that among maternity and child welfare workers she had found the belief widespread that breast feeding was diminishing, that this was the result of maternal over anxiety or because the mothers were going out to work and that as artificial feeding was now so easy and safe this state of affairs did not matter It was obvious that if such views were held advocacy of breast feeding could not always be as whole hearted as many people desired Dr Cassie thought that the mother s diet especially as regards first-class protein was not sufficiently taken into account Figures for Birmingham showed that while the babies were under the care of the midwife only 3 per cent were artificially fed, and that by the time the health visitor took charge the figure had jumped to 12 per cent Better management of breast feeding and careful instruction of the mothers was the main solution of the problem

Dr C K J HAMILTON thought that proper management was the most important factor in success it was a mistake to imagine that breast feeding was a natural process which could be left to maternal instinct as was shown by the fact that breast feeding had been re established successfully in fifty out of fifty four cases Failure began when the mother left her bed and went back to household duties and it was important that mothers should be able to obtain prompt advice when there was any temporary diminution in secretion Advice at the ante-natal clinics should be of great help Test feeding was most valuable in estimating the degree of failure and in helping in its correction

The CHAIRMAN (Dr Lindsay Dey) emphasized the great importance of breast feeding during the first three months of life Postgraduate instruction of doctors in this matter was necessary Dr J GREENWOOD WILSON (M O H Cardiff) agreed that more knowledge of the advantages of breast feeding over bottle feeding was needed Working back from a series of children leaving school he had been unable to detect any difference between those who had been breast fed and those who had been bottle fed in infancy He thought from personal experience that well managed bottle feeding was easier to attain than well managed breast feeding Modern unrest and pleasure seeking were perhaps the strongest influences against breast feeding Dr P DE FREMERY (Holland) described the activity of the lactogenic and oestrogenic hormones in goats Under the influence of oestrogenic substances the udder developed percutaneous administration being best Dr A G WATKINS (Cardiff) thought that the

solution of the problems of lactation must begin with the adequate training of medical students and nurses Public health workers in particular required more detailed practical instruction Instruction of mothers during the ante natal period was most essential Dr RUTH YOUNG (New Delhi) said that in India the majority of infants who survived the first month showed a steady increase in weight up to the seventh or eighth month of life Yet the diet of many of the mothers was extremely defective according to usually accepted standards often lacking entirely in first class protein frequently in fat and sometimes in fresh vegetables It was possible therefore that defective diet was not such an important cause of failure of breast feeding as had been suggested Dr MAVIS H D GUNTHER (Esher) speaking as a mother who had breast fed her baby pointed out that breast feeding entailed a big social sacrifice and it was also far too much wrapped up with modesty Mothers fed their babies in solitary state and lacked encouragement Dr DOROTHY E MASON (Bethnal Green) described the overfeeding that resulted from rigid insistence on a four-hourly programme In her district recently abscess of the breast had appeared as an important cause of failure of breast feeding and might be due to non emptying of the breasts Dr E C DAWSON (Derby) stressed the significance of psychological factors The baby was most often brought to the general practitioner for fretfulness and he found small doses of sedative drugs (bromide and chloral) most valuable as a first step in getting things right again

Dr F M B ALLEN (President Belfast) remarked that the problem had existed in ancient Rome As a teacher he found it essential to be dogmatic with definite rules, especially paying attention to the difficulties and how they might be overcome

BEIT MEMORIAL TRUST FOR MEDICAL RESEARCH

A meeting of the Trustees of the Beit Memorial Fellowships for Medical Research was held on July 13 for the election of Fellows and other business

The total number of Fellowships held by full-time workers during the year 1937–8 was twenty-three The number of candidates at the present election was higher than usual Five applied from Canada and three from Australia Fortunately reserve funds made it possible to award more Junior Fellowships than are ordinarily given each year and the election of twelve new Junior Fellows brought the total of those elected since the beginning of the Trust in 1910 to exactly 200 A fresh edition has been printed this year of the Green Book, which summarizes briefly the after careers of each Fellow and their present position in research

Election of New Fellows

The following elections were made

Senior Fellowship (value £700 a year)—David Ezra Green M Sc Ph D To continue his research on the role of vitamin B_1 in the oxidation of pyruvic acid and to study a new flavin-protein compound in milk (Institute of Biochemistry Cambridge University)

Fourth Year Fellowship (value £500 a year)—Myer Head Salaman M A M D To continue his research on vaccinia and animal pox viruses (Lister Institute of Preventive Medicine London)

Junior Fellowships (normal value £400 a year)—Geoffrey Bourne D Sc Biochemist Commonwealth Advisory Council on Nutrition Sydney N S W 1937 Proposed research the significance of vitamin C in the endocrine system (Department of Human Anatomy Oxford University) Andrew Lawrence Chute B A M D *Proposed research* experimental studies in metabolism of the brain (Department of Physiology University College London) Robert Oswald Lennard Curry M A Ph D Proposed research the physiology of speech disorders by photographic study of laryngeal movements (University College London) James Frederick Danielli B Sc Ph D Proposed research the permeability of normal and denervated muscle to metabolic products and to drugs (Institute of Biochemistry Cambridge University) John George Dewan M A M D Proposed research insulin shock treatment of schizophrenia by experimental studies of brain metabolism (Institute of Biochemistry, Cambridge University) Catherine Olding Hebb, M A, Ph D Proposed research the effect of thoracic sympathectomy on the activities of the lung (Department of Physiology, Edinburgh University) Bernhard Katz M D Ph D Proposed research electric excitation and transmission of impulses in nerve and muscle of animals (Department of Biophysics University College London) Jonas Henrik Kellgren M R C P, F R C S Proposed research painful conditions of the limbs and back (Department of Clinical Research University College Hospital) John James Duncan King Ph D L D S Proposed research dental caries and parodontal disease (Medical School Sheffield University) Hermann Lehmann, M D Ph D Proposed research blood sugar in animals, and iron metabolism in plants (Institute of Biochemistry Cambridge University) Walter John O'Connor M B B S Proposed research effect of strophanthin on the oxygen consumption of the heart (Laboratory of Pharmacology Cambridge University) Harold Scarborough M B Ch B Proposed research mode of destruction of vitamin C in the human body (Clinical and Chemical Laboratories Royal Infirmary, Edinburgh)

All correspondence of Fellows and candidates should be addressed to Professor T R Elliott M D F R S honorary secretary Beit Memorial Fellowships University College Hospital Medical School University Street, W C 1

THE CANCER CAMPAIGN

Viscount Hailsham presided at the sixty seventh quarterly meeting of the Grand Council of the British Empire Cancer Campaign held at 11 Grosvenor Crescent on July 11 On the recommendations of various committees the following grants were made totalling £3 715 in addition to the sum of approximately £45 000 which has already been approved in grants for the calendar year 1938 £1 100 towards the expenses of the work of the Radium Beam Therapy Research £750 for the expenses of the research being carried out by Mr F C Pybus at Newcastle £300 to Dr P R Peacock at the Glasgow Royal Cancer Hospital for the salary of a whole time assistant £495 for the salary of the physicist at the Strangeways Research Laboratory Cambridge £750 for the expenses of certain investigations being carried out under the direction of Dr P M F Bishop and Mr H J B Atkins at Guy's Hospital £270 to Dr John Bruce at Edinburgh University, for part time investigations and £50 for a replacement in apparatus at the Strangeways Research Laboratory

The Council decided that the fifth biennial informal conference of cancer research workers should be convened by the Campaign in the spring of 1939 It was gratified to learn that King Edward's Hospital Fund for London had intimated its willingness to co operate with the Campaign in its newly inaugurated scheme for the co ordination of clinical cancer research by stimulating the establishment of efficient follow up systems for cancer patients in the hospitals

A selection committee is considering applications for the post of full-time Medical Secretary and Registrar When appointed the successful candidate will proceed to the United States and other centres to study the latest methods of dealing with statistical information The new department of the Campaign will deal with the records of approximately 17 000 new cases of cancer annually, supplied by over 100 hospitals in the London metropolitan area

Grand Council approved of the reappointment of Dr G Cranston Fairchild as the William Morris Research Fellow in Radiology at Mount Vernon Hospital for a further period of three years subject to an annual recommendation from the Council of the Radium Institute and the Mount Vernon Hospital This Fellowship was created by the Campaign in 1931 at the request of Lord Nuffield who provided a sum of £25 000 for the purpose of promoting research work and study concerning the treatment and cure of cancer by radiology

Local News

ENGLAND AND WALES

National Hospital New Wards and Research Department

The new wing of the National Hospital for Diseases of the Nervous System perhaps better known as Queen Square Hospital, London which was opened by Queen Mary on July 19 increases the accommodation of the hospital by 43 beds and provides two entire floors and a basement for research work The building adjoins the old hospital overlooking the square, and is severely simple in its lines with no ornamental detail

The two highest of the seven floors are devoted to single bed wards where patients can have the privacy that is often so desirable in an institution for this class of case Each ward has one of its walls consisting almost entirely of window which can be opened out upon the gardens and trees of the square below The fifth floor contains two operating theatres with a large sterilizing room and a room for x ray diagnosis Students galleries are built in the theatres in such a way that their occupants can obtain a close view of an operation from the best possible angle although separated from the main theatre by sloping glass screens Below this theatre floor there are three floors occupied by four bed wards two of them surgical and one medical and here again one of the walls is glazed and can be opened out to give the ward the effect of a balcony The first floor ground floor and basement are given over to the purposes of laboratory research and teaching The post mortem department is in the basement with two small chapels attached one for Jewish rites On the ground floor there is a large lecture theatre and two sets of consulting rooms where the physicians and surgeons of the hospital can see private patients and all the remainder of the space on these floors apart from a library and a refectory is occupied by laboratories The furnishing of these laboratories has had special attention and in the search for ideas some of the best equipped laboratories in various parts of the world have been visited including the famous physical chemistry institute of Upsala The complicated system of electrical and mechanical services has been installed in such a way that in the finished building they obtrude themselves to the least possible extent All the benches are standardized and movable and can be placed anywhere around the walls or in the centre of the room with the certainty that the necessary services will be available at any point On each landing there is a clock which dials the number of any member of the staff who is wanted and the number is dialled fifteen times in succession until the truant is traced Electrically controlled blinds close the windows when a button is pressed In the private wards the lights can be dimmed from outside without the necessity of entering and disturbing the patient There are innumerable contrivances of this kind Another amenity is the provision of waiting rooms on each floor for the friends of patients

The new building which is not yet occupied—the shortage of nurses here as in other new hospitals is one cause of delay—is by no means the end of present developments at Queen Square It is hoped to build a new nurses hostel for which a neighbouring site has been acquired and to reconstruct the out patient department The new wing especially the research department has been rendered necessary by the fame of the research work in neurological medicine and surgery done at this hospital The accommodation for research became inadequate and in 1935 the Rockefeller Trust gave £60 000 towards the building on condition that another £60 000 was raised The Trust gave a like sum to be invested for the endowment of research The second £60 000 was more than secured from three sources—£29 000 from Lord Nuffield £11 600 in response to a broadcast appeal and £20 000 from picture house collections In addition there have been many other large gifts including £1 000 from the Corporation of the City—recalling the fact that the hospital itself was started as the result of a Mansion House meeting—and the building fund has now reached £158 000

Voluntary Hospitals of Sheffield

The Duchess of Gloucester visited Sheffield last week to inaugurate an appeal for £1 000 000 for the city's voluntary hospitals During the day she attended a meeting at the City Hall opened a new ward at the Children's Hospital for the treatment of children under 1 year suffering from dietetic disorders and laid the foundation stone of the new maternity block at the Jessop Hospital It was announced by Mr W R S Stephenson chairman of the executive committee of the appeal that two thirds of the sum required would be found by employees and employers in the district who already contributed to the maintenance of the hospitals through the penny in the pound scheme The remaining third would it was hoped be subscribed by the general public and public bodies The aim of the scheme of reorganization of the Sheffield hospitals was to centralize all specialized work At the Jessop Hospital Mr James Henderson chairman of the board of management explained that additional maternity beds were the most urgent of Sheffield's hospital needs and the financing of the new block at that institution would be the first call on the £1,000 000 appeal fund

A Convalescent Home in Kent

The opening of a convalescent home near Tunbridge Wells by Sir Kingsley Wood on July 1 marks the recognition by the Kent County Council of the need for restoring the individual to fuller health than is afforded by actual hospital treatment The establishment of this home has been made possible through the generosity of Mrs Vera Salomons who has presented the house and grounds by deed of gift The house was formerly the home of her family and is being named the David Salomons House in memory of the father of the donor It is a spacious country house standing in about thirty five acres of beautifully wooded grounds and has been adapted by the County Council to provide accommodation for seventy female patients between the ages of 15 and 45 In view of the importance of diet during convalescence a cook dietitian has been appointed and every effort has been made to depart from the hospital atmosphere and to create restful and pleasing surroundings There are adequate facilities for rest and recreation both indoors and out and there is a well-equipped theatre attached to the house for the entertainment of the patients Until recently convalescent treatment has only been possible through the agency of voluntary bodies or by the private arrangements of the patient and the fact that the Kent County Council has provided such treatment as part of its public health service is a noteworthy advance in the care of the sick The decision to use the home for female patients in the 15–45 age group is important While the average man after his discharge from hospital has some time on sick benefit before returning to work the housewife who will be represented by many patients in this group often goes straight from hospital to full and arduous work in the home

Notification of Measles and Whooping-cough in London

The Minister of Health on July 15 inserted a notice in the *London Gazette* advertising regulations which it is proposed shall come into operation on October 1 next for the compulsory notification by medical practitioners of all cases of measles and whooping cough occurring in the Administrative County of London except in the following cases (1) If a previous case of measles or whooping-cough has occurred in the house and has been notified within the preceding period of two months (2)

If the case is being treated in a hospital for infectious diseases (3) Where the patient has been admitted into a hospital belonging to the London County Council Regulations which are already in operation in certain Metropolitan Boroughs for the notification of one or both of these diseases will be rescinded by the new regulations Measles and whooping-cough are notifiable only in those places for which special regulations of this kind have been made Reference to this matter was made in our Epidemiological Notes last week

Cost of Medical Care to Local Authorities

The Minister of Health has now issued Part I of the Costing Returns for the year ending March 31, 1937 (H M Stationery Office, 1s 3d) The returns relate to all the principal institutions (other than infectious disease hospitals) for the treatment of persons in need of medical or surgical care and attention which are administered or utilized by local authorities in England and Wales The institutions for which particulars are given comprise Poor Law hospitals, general hospitals administered by local authorities sanatoria and other residential institutions for the treatment of tuberculosis and maternity homes and hospitals The main object of this publication is to assist local authorities in the economical administration of the institutions under their control by enabling each authority to make comparisons between the average costs of their own institutions and of the comparable institutions belonging to other authorities Careful investigation into the causes of divergencies in unit costs is a valuable method of securing economies and improvements in methods of administration

Board of Education Report

The annual report of the Board of Education for 1937 (Cmd 5776, H M Stationery Office, 3s 6d) covers the calendar year and is, as usual, combined with the Board's statistical tables, most of which relate to the period ending in March or July The introduction to the report mentions some of the outstanding events of the year One was the introduction of the Government scheme for the development and extension of opportunities for recreation and physical education, a fuller account of this is given in Chapter I The Board's total estimate for the year 1937–8 was £49,500,000—nearly £1,500 000 more than that for the previous year Most of this increase was due to larger expenditure by local authorities on elementary and higher education Substantial progress was made in all branches of educational activity including the School Medical Service, and in particular the report comments on the more rapid growth in the provision of nursery schools Widespread attention has been given by local authorities to the institution of preventive and instructional measures designed to promote the safety of children on the roads The results of an inquiry into children's homework and the conclusions of the Board on the subject were published in 1937 The Board again calls attention to the importance of the appointment of organizers of physical education At the beginning of 1936, out of 316 local education authorities, only 124 employed these organizers By the end of last year the number had increased to 232 authorities Steps were taken to meet the need for an increased supply of teachers capable of giving instruction in physical training The Board explains in some detail the circumstances in which the Government scheme for the development of opportunities for recreation and physical training was launched During the past quarter of a century educational practice has been steadily moving from a narrow interpretation of formal training to the wider conception of developing the individual A similar change has transformed physical education in the schools from a system of formal drill into one of free exercise embracing not only gymnastics and physical exercises but games swimming and all sorts of outdoor activities This wider view of the educational process was recognized in the Education Act of 1918, which gave local authorities power to supplement and reinforce the instruction given in the schools by providing opportunities of social and physical training for school children and young persons But the opportunities for young people to indulge these interests have in the past been incomplete These considerations moved the Government, spurred on by the British Medical Association Report, to set up the National Fitness Council, and through the Physical Training and Recreation Act 1937, to confer on local authorities new and extended powers for providing gymnasiums, playing fields camps community centres, swimming baths, and the like The report gives some account of the work which the National Fitness Council has already accomplished From the section on school meals and milk it appears that only about half the children in public elementary schools take advantage of cheap milk The number of authorities providing school meals or milk during the year ending March 31 1937, was 247, compared with 235 in the preceding year by the end of the calendar year 1937, 249 authorities were providing meals or milk The Board points out that the Advisory Committee on Nutrition recommended that children should take from one to two pints of milk a day, and it regrets that parents do not appreciate more fully the opportunity provided by the milk-in-schools scheme of obtaining so valuable a food for their children at half-price

Preston Hall, Maidstone

Two matters call for special notice in the report of the medical director of British Legion Village, Preston Hall for the two years ended September 30, 1937 The first concerns the future of this settlement It has been obvious for some time that Preston Hall could not continue as a centre for the treatment of ex-Service men only Indeed, 38 per cent of those now under treatment are not ex Service men The council of management has therefore recommended to the National Executive Council that the British Legion should continue to be the owners of Preston Hall and be responsible for its future and that a separate appeal should be made on behalf of Preston Hall 'with the clear understanding that the money would be required to carry on a national work for the whole of the community, and not for ex-Service men only' The second matter is the "arrested-cases scheme' A number of patients in whom the disease has been arrested and who are still working in Preston Hall industries are now resident not in the Village Settlement itself but in houses in the near neighbourhood These houses are being built by private enterprise, and are purchased or rented, sometimes with the assistance of the British Legion In addition, twenty-four settlers considered to be within the category of "arrested cases' have left the Village and are working elsewhere in England It is emphasized that no pressure of any kind is brought to bear on these men to move that no relapses have been reported in this group and that the introduction of this scheme has had no effect on the number of fresh applications for admission to the settlement

London Emergency Bed Service

The Voluntary Hospitals Emergency Bed Service has now completed its fifth week of working, and in spite of having taken deliberate steps to avoid any rush of calls when it was opened it has already dealt with well over 500 cases The actual cases offered have varied very considerably, and though all types of medical and surgical emergencies have been dealt with, the average length of time between receiving a message from a doctor and obtaining admission for his patient is still in the neighbourhood of five minutes It is possible, if all the circumstances are favourable, to complete the arrangements for the admission of a patient within three minutes as was done in the case of a doctor who telephoned at 1 17 p m asking for admission for a patient suffering from acute appendicitis, by 1 18 p m the Miller Hospital had agreed

to take the case at 1 19 p m an ambulance had been ordered and at 1 20 p m the doctor was informed that an ambulance would call for his patient Many doctors are apparently still reluctant to use the Service as is evidenced by the fact that on several occasions doctors who have made use of it have said that they had already tried three hospitals all of which had recommended them to ring Metropolitan 8781 In one instance a doctor said that he had spent over an hour trying to get admission for his patient and when he finally rang the Service admission was obtained in seven minutes The Service is now capable of dealing with any call that may be made upon it, and it is no longer necessary for doctors to hold back for fear of overwhelming an untried institution

The Case for Cremation

A conference organized jointly by the Cremation Society, of which he is president and the Federation of British Cremation Authorities was opened by Lord Horder on July 22 at Balliol College Oxford Lord Horder said that earth burial which had long been a luxury was to day a social crime On the score of lack of reverence this at least could be said for cremation—that it spared the irreverence of exhumation which was the lot of so many thousands of bodies and it spared also the neglect of graves so evident in many cemeteries Moreover, the crematorium chapel was more comfortable than an open graveside and spared much to mourners who often attended funerals in an impaired state of health due to the anxiety of the period through which they had passed *Cremation by reason of its system of certification* enforced by the law both prevented and detected crime Death certificates signed by medical men who had not examined the bodies after death were impossible in the case of cremation, for which two medical certificates were demanded and these must be completed to the satisfaction of a medical referee before cremation could take place Leeds City Council was represented at the conference and this week Alderman Masser has opened a new crematorium at Cottingley Hall Dr J Johnstone Jervis medical officer of health for Leeds in a handbook describing the Cottingley Hall Crematorium writes If anyone were to ask me what, in my opinion was the ideal method of disposing of the dead I would unhesitatingly reply cremation The reasons for this answer are first that it is the most hygienic method secondly that it is the most expeditious method and thirdly, that it is the method *best suited to the times in which we live* Who will say that a graveyard in the midst of a thickly populated city or even in a suburban area, is a benefit to the people s health?

SCOTLAND

Edinburgh University Graduation

At the medical graduation of Edinburgh University on July 20 Lord Tweedsmuir was installed as Chancellor of the University in succession to the late Sir James Barrie There were thirteen recipients of the honorary degree of LL D including the Governors General of Canada India and Australia and two Cabinet Ministers one of whom was Dr Walter Elliot the Minister of Health Lord Tweedsmuir in his address, said that a university was not a mere wicket gate which once passed was no more thought of it should influence every stage of life. It had two plain duties—to transmit knowledge and to advance knowledge—and both required equal emphasis General culture was of little value to a young man if he was going to starve but on the other hand if they had only what had been called the service station conception of a university they would have men entering a profession without having been taught to think The purpose therefore of the university should be to combine humanism with technique The other primary function of a university was to pursue truth by research experiment and speculation Our forefathers based all learning on the study of philosophy and Lord Tweedsmuir suggested that they should return to an insistence upon the liberty of the mind If they could give to the youth minds accustomed to think and inspired with a reverence for thought and at the same time give them the perspective created by understanding our long human story they would be endowed with confidence and hope It was often said that modern youth lacked the enterprise stamina and fortitude of their fathers, but he believed this to be untrue Those who to day entered the church medicine law or commerce found the technique of these professions more elaborate than it was in their fathers day that delicate structure called civilization had to be maintained in a world full of destructive forces The mechanism of society to-day had become so intricate that it was far more exposed to disaster than the simpler mechanism of earlier days and they could only preserve the standards by the constant exertion of intelligence The Chancellor afterwards conferred the M D degree upon sixteen graduates and those of M B Ch B upon 163 graduands

Principal of the Veterinary College

The Governors of the Royal (Dick) Veterinary College Edinburgh have appointed Colonel Sir Arthur Olver C B C M G F R C V S to be principal of this institution in succession to the late Dr O Charnock Bradley Sir Arthur Olver who is 62 recently retired from the post of Animal Husbandry Expert to the Imperial Council of Agricultural Research in India In 1908 he was appointed Assistant Director General of Army Veterinary Services and for his work in the war he was awarded the C M G and C.B He was instrumental in introducing many improvements in animal husbandry and veterinary education, among them were dairy farms in each of the five provincial veterinary colleges of India He also drew up the scheme for a higher-grade veterinary college in India in which he laid special stress upon the subjects of animal nutrition and animal genetics

Conference on Health Education

At a conference organized by the Department of Health for Scotland in the Empire Exhibition, Glasgow on July 19, Mr H J Scrymgeour Wedderburn Parliamentary Under-Secretary of State for Scotland who presided said the future of Scotland depended on the health of the young people who were leaving school at the rate of 90 000 a year Mr Joseph Westwood M P *suggested that the three routine medical inspections* during school life could be cut down to two and that medical staffs might thus be freed for work among pre school children Medical services should be provided for the family in the same way as they were for the insured worker The law should be amended so that local authorities might provide meals for school children as a preventive measure a good midday meal would prevent much of the debility which they were now seeking to remedy The medical profession must work in the closest harmony with the local municipal services, and the State must give local authorities the necessary financial assistance Mrs Walter Elliot speaking of the young citizen pointed out that there was really no control after boys and girls left school there were many voluntary organizations to cater for them but these did not attract more than one in three of the juvenile population When people were removed from the slums to charming new houses their social interests and leisure time should also be catered for Sir John Boyd Orr considered that the physique of the youth of to day was better than that of his father s generation and he believed that twenty years hence there would be

still further improvement The extension of the school-leaving age by another year would be a great benefit in providing another year's discipline and much could be done in the last two years of school to impress upon the child that its future lay in its own hands A healthy physique and character were of more importance for success in life than a good deal of money or a great deal of academic learning The youth of to-day was not so much impressed with the necessity for getting on in life as was the youth of twenty-five or thirty years ago, but he was beginning to realize that he was a debtor to the community, and that he had to make some contribution for all he had received from it The chairman said that Scotland was a small nation with a population under five millions The fall in the birth rate had raised many issues of high policy in the State and one problem was to secure that those who were born were equipped to lead a full and useful life The conference had brought home to them that the health organization of Scotland was doing a great work, although it was not perfect and was not sufficiently used They were now spending £20,000 000 in Scotland on health services of every kind, but he doubted whether they were getting as high a return for it as they ought

Correspondence

Bragg-Paul Pulsator

SIR —On July 8 an S O S message was sent out by the British Broadcasting Corporation asking for a Bragg-Paul pulsator, which was required for a case of respiratory paralysis at the Ipswich Hospital A pulsator was at once sent off from the London Hospital, but did not arrive in time In a recent article (*British Medical Journal* June 4, p 1206) Dr C J McSweeney, of the Cork Street Hospital in Dublin, described the use of the pulsator, which he said had enabled him to tide over the period of complete paralysis of the thorax muscles, and to save life, in twenty-six cases Quite recently a pulsator was required for a serious case in Belfast, fortunately, a spare pulsator had just arrived at Dr McSweeney's hospital, and was sent off at once It was hurried through the Border Customs, and arrived in time to be applied successfully It is hoped that by this time the child is out of danger It seems obvious that pulsators should be kept in readiness at known centres so as to be available for immediate use by qualified practitioners

The particular form of apparatus which goes by the name of the Bragg-Paul pulsator had its origin in an attempt to give relief to a friend of mine and to his family My friend suffered from an extensive paralysis he was quite unable to breathe For months he was kept alive by nurses and relations who used a simple method resembling that which is prescribed for cases of apparent drowning I thought that it might be possible to reduce the labour and inconvenience and I arranged that a football bladder should be bound upon my friend's chest connected with a similar bladder fixed between two hinged boards By closing and opening the boards the chest was alternately compressed and allowed to recover by its natural elasticity It was very much a home-made apparatus but it worked and was in use for a long time I then asked my friend Mr Robert W Paul to improve the design and if possible to draw power for working it from the water mains electricity was not then available This he did in a very ingenious manner For three years or so my friend's breathing was accomplished entirely by the pulsators we made He lay in bed all the time The application of the apparatus caused him no inconvenience nor did it interfere with his nursing The tube connecting the pulsating machine with the hollow bandage which had now replaced the football bladder was hidden by the coverings of the bed and there was no evidence of anything unusual except the quiet click-clack of the pulsator in another part of the room

Mr Paul then designed the apparatus for use on the electric circuit and has recently improved it in many ways, which have been suggested during its use in hospitals Among other changes the electrically driven gearing is enclosed in an oil bath, and the new pulsator is practically noiseless Several pulsators have been made by Mr Paul, or under his direction, because he is naturally interested in perfecting the design I am sure that Mr Paul (69 Addison Road, London, W 14) will gladly give advice to any person or institution proposing to procure one of the new pulsators To avoid misunderstanding I would add that I am not financially interested in the apparatus —I am, etc,

The Royal Institution, London, W 1, July 21 W H BRAGG

Abortion and the Law

SIR —There has been so much discussion in the lay press on the different aspects of my recent prosecution that, for the first time, I should like to make some points clear to my fellow members of the profession through your columns

Before this case was brought before the courts it is a fact that, despite what has been said to the contrary, the question of even therapeutic abortion has been a source of great anxiety to doctors, chiefly those in general practice Uncertainty exists because it is so difficult to define what constitutes an indication for the operation

We all know that there are many vague and almost indefinable conditions which, as serious danger to health though not to life, are much more important than many straight cases of heart or chest disease The latter often suffer little or no real depreciation of health, but they carry the label of a named disease, which is readily accepted by laymen, the former class, by reason of the lack of concise clinical definition, may not be readily convincing cases in any subsequent legal investigation These patients form the real problem

It is comparatively simple for the consultant obstetrician behind his defence of special knowledge and experience, particularly in large centres, to induce abortion, but it is a very different problem for the general practitioner in a small town or country district Between the pressure exerted on him by the patient and her husband on the one hand and the justifiable fear of misinterpretation of his action by gossips, or even the police, on the other, his position can be very difficult

For years I have been impressed by this difficulty and decided to bring forward a test case, when the opportunity arrived, in which there would be no real danger to *life* (except suicide, which is occasionally committed by girl patients) but in which one might very strongly suspect great danger to health I was also concerned to establish in the eyes of the law that mental health was just as important as physical health and in certain cases perhaps even more so This does not mean that I regard abortion as necessary in most cases of insanity I am informed by my colleagues practising psychiatry that the operation plays little or no part as a treatment or prophylaxis of most forms of insanity I also wish to state once again that I did not bring the case forward as an attempt to alter the law by direct action, but to obtain a further definition of the present law

The Attorney General admitted that abortion is legally recognized when life is in danger Now we know that it is also admitted where there is *serious* danger to health Much emphasis must be placed on the italicized word *serious* I would not have it be believed that I have worked for a loose interpretation of a law which I have observed myself perhaps too rigidly Nevertheless I cannot help feeling that the majority of the profession would feel that they are on safer ground if the precedent just established were incorporated in a new Act passed in days of much more knowledge of medicine surgery, and psychology than was available in 1861—I am etc,

London W 1 July 25 ALECK BOURNE

SIR—We read in the newspapers here that Mr Aleck Bourne is being prosecuted in London on account of the performance of an illegal operation From what one has seen it would appear that the operation was the production of abortion in a girl who had become pregnant through rape It would also appear as though he had done this openly perhaps as a test case If this is so he surely deserves not only the thanks of his medical colleagues but also the gratitude of the public, who may at any time be victims of such assaults No doubt he will have the utmost support from the great body of his colleagues at home

The subject has of course received a good deal of publicity in your columns of late and different views have been expressed I think it was recently reported that, during a discussion on the subject Mr Justice Humphreys had expressed the opinion that a doctor feeling he should take this course would be advised to collect his colleagues about him thus being open in the matter, and that he then would have little to fear from the law It would appear that this is what has here been done, and, if so it is to be hoped that the law will play its part fairly and honourably

Why after all, the inconsistency? If it is technically illegal to procure abortion, then why has it been winked at where the reason was the preservation of health if an attempt is to be made to enforce it in cases where the motive is to relieve the patient and her relatives of what is to them a very real misery? It has long been realized by many, and prominent among them the late Mr Justice McCardie that it was high time that such abortions were legalized and now surely it is more than time that this should receive official recognition Doubtless a good deal will appear in the *Journal* regarding this case from better informed and abler pens than mine, and members of the profession will follow events with interest and feeling—I am, etc,

Natal S Africa July 3 DAVID T MACLAY M B

The Unconscious Mind and Medical Practice

SIR—In the *Journal* of July 9 (p 93) the late Dr Harry Campbell confesses to a difficulty in understanding what the unconscious of the psycho analysts may be, and blames them for not giving a precise definition of the term Speaking not as a psycho analyst but as a medical man interested in psychological medicine I share his difficulty but recognize the impossibility of defining one unknown quantity in terms of another Like Dr Campbell, I do not wish to initiate a useless discussion on terms and I have found the psycho analyst's view of the unconscious quite clearly put forward by Galton many years before psycho analysis had become the little understood but freely discussed and much misused term that it is to day True, Galton explains it by analogy only but perhaps this is as far as it is possible to go Interested readers should refer to the Everyman's Library edition of *Inquiries into Human Faculty* wherein is a great deal of extremely stimulating material of which the section on psychometric experiments has most bearing on the present question On page 131 Galton writes

> The furniture of a man's mind consists of his recollections and the bonds that unite them As all this is the fruit of experience it must differ greatly in different minds according to their individual experiences
>
> When I am engaged in trying to think anything out the process of doing so appears to me to be thus The ideas that lie at any moment within my full consciousness seem to attract of their own accord the most appropriate out of a number of other ideas that are lying close at hand but imperfectly within the range of my consciousness There seems to be a presence chamber in my mind where a full consciousness holds court and where two or three ideas are at the same time in audience and an antechamber full of more or less allied ideas which is situated just beyond the full ken of consciousness Out of this antechamber the ideas most nearly allied to those in the presence chamber appear to be summoned in a mechanically logical way, and to have their turn of audience

The passage is too long to quote further but it is of interest to note that it was written in 1883—I am, etc,

Sheffield July 20 E FRETSON SKINNER

The Final M B, B S.Lond

SIR—Sir Ernest Graham Little's letter in your issue of July 16 (p 153) seems to suggest that there is now some cause for congratulation at the recent decision of the Royal Colleges *not* to co operate with the University of London in regard to the final medical examinations With all due respect to Sir Ernest with whom I have for many years maintained the friendliest relationship may I as a general practitioner who is a graduate of London University and a holder of the Conjoint diplomas as well but who has also maintained close touch with his university ever since graduating on Convocation and as a member of the Standing Committee since 1927 be allowed to express a contrary opinion? I would like everyone to take the broadest possible view of the whole matter

Ninety per cent of medical men enter into general practice—that is, into medicine in the widest sense When we begin a course of study at one of the London medical schools we do so with one object in view—namely to get qualified to get upon the *Medical Register* to be able to earn a living in the field which we have chosen and to be able to attend people in sickness and distress Once engaged in general practice the question of what degrees or diplomas we hold plays no part in the scheme of things at all Only one thing counts—work—and for that we require not degrees but common sense energy keenness concentration and an insight into the patient's mind If further help specialist skill or additional advice are required we must know where to get them whom to call in and the right moment to do so We who hold the M B B S Lond degrees are not conscious of superiority over our colleagues who possess merely the Conjoint diplomas Not only the public but the profession itself pays no more deference to the M B B S Lond than to the Conjoint diplomate Many London medical graduates are anything but a success in practice whereas many a Conjoint man has the biggest and most successful practice in the whole district We must look

these facts in the face and see them as they are and not just as we would like them to be It is popularity that counts in general practice not the possession of degrees

Since 90 per cent of our medical students are engaged primarily in securing a registrable qualification in order to be allowed to practise, is it not fantastic that twenty men in one class should all end up with different degrees and diplomas after the same course of study? Is not the greater plea not merely for one common final examination in London but for one State final examination for everyone? After that, specialistic and higher degrees and diplomas would still be available in medicine, surgery, midwifery and gynaecology laryngology ophthalmology, and so on

I maintain that every medical man, after five to six years study, *should be a graduate* and should exercise a graduate's Parliamentary vote It is not really difficult to arrange a final medical examination in London which at once gives the M R C S, L R C P diplomas and *ipso facto* passes three-quarters of the final London M B B S leaving only one quarter such as more advanced papers in medicine, etc, to be completed to get the degrees—I am etc,

X-Ray Screening Stand for General Practice

SIR—I should like to congratulate Dr Douglas Gordon on his description of a screening stand suitable for fluoroscopic examination of the chest and abdomen (*Journal* July 2 p 21) I feel however that his description of the simplicity of this method of examination may be misleading as it is by no means an accurate method of assisting in diagnosis, in fact it may easily prove to be the reverse Early lesions in the lungs are often not visualized by screen examinations and when of sufficient density or translucency to reveal themselves can seldom be differentiated Such a screen examination is more profitably made after an examination of the preliminary chest radiograph A screen examination of the abdomen without utilizing an opaque meal is only likely to give useful information in cases where the presence of a foreign body is suspected In such cases a negative finding of necessity would have to be verified by radiography

I trust that none of these criticisms will deter any medical practitioner from making the fullest use of radiology in his practice, while realizing the limitations of fluoroscopy *per se* In congratulating Dr Gordon on the design of his stand, which should prevent any recurrence of 'the sudden attack of alopecia, one cannot help remembering that it is the patient who receives most of the rays A filter of 1/2 mm of aluminium should be helpful—I am, etc,

London W 1, July 19 J V SPARKS

Prophylaxis of Measles

SIR—During the months of May and June we have had the usual administrative difficulties in the children's wards of the Royal Northern Infirmary at Inverness on account of measles In our efforts to immunize not yet infected children Lederle's immune globulin was used exactly as described by Dr T N Parish (*Journal* July 9 p 65) The results were disappointing as in every case in due course measles developed All the remedy seemed to do was perhaps to limit the severity of the clinical picture and to delay the incubation period—at much expense to a voluntary hospital I am further prompted to write this letter as I have just read the following in a Northern paper under the heading "Boy loses eye after measles Gets £3,500 damages

Three year old Joseph Henry West, of Dickens Street Miles Platting Manchester received £3,500 and costs at Manchester Assizes yesterday for the loss of his right eye after an attack of measles Through his father he sued the Manchester Corporation for damages for personal injuries

'Mr G J Lynskey, K C, for the boy, said that he had had an attack of measles, and following this an attack of scarlet fever, after which he was admitted to Monsall Hospital Manchester While in hospital he had another attack of measles, as a result of which his eyes became septic and the right one had to be removed The claim on behalf of the boy Mr Lynskey contended was that he was not given anti measles serum and that he was exposed while suffering from scarlet fever, to risk of infection from another child who was a suspected case of measles

—I am etc

Eventration of the Diaphragm

SIR—In the *Journal* of April 30 (p 948) there is a report by Mr A L McFarlane and Dr W N Dickenson of a case of hernia through the diaphragm The case reported seems to be almost identical with one which I saw some years ago, and which was fully described in the *Australian and New Zealand Journal of Surgery* of October 1932 My patient was a schoolgirl aged 14 who had an ovarian cyst Operation showed a complete absence from the general abdominal cavity of small intestine ascending colon, and half the transverse colon and subsequent x-ray examination revealed these organs lying above the liver within the thoracic cavity The diaphragm, greatly elevated, seemed to be above the intestines She had had no other disability, and took an active part in her school games Such a condition was described by Petit in 1774, and later Cruveilhier also gave account of it He gave to the condition the name "eventration of the diaphragm, under which name some half-dozen cases have been reported in the *American Journal of Roentgenology*—I am, etc

Christchurch, New Zealand June 17 P STANLEY FOSTER

Anaemia and the Gastro-intestinal Tract

SIR,—Dr Janet Vaughan in her recent article on anaemia and the gastro intestinal tract (*Journal* July 9, p 57) states "There is no evidence that intestinal abnormalities affect the utilization of vitamin C In actual fact, however, there is abundant evidence to the contrary It is becoming increasingly evident that deficiency states may occur even when individuals are taking diets adequately supplied with vitamins That vitamin C may not be utilized although taken in adequate quantities is suggested by several interesting observations

1 Scorbutic-like syndromes may develop in individuals taking three oranges daily (Wright and Lilienfeld 1936)

2 Scorbutic patients who have failed to respond to fruit juices or ascorbic acid orally do so when the latter is administered intravenously (Birch *et al* 1933)

3 Wright and Lilienfeld (1936) have actually induced relapses in such patients by placing them on a regimen of vitamin C orally, then cured the relapses by the parenteral exhibition of the vitamin

4 Mahlo and Multi (1936) believe from their experiments that there is a failure of absorption of vitamin C in patients

with gastro-enteritis owing to the presence of a specific peroxidase which destroys the vitamin in the stomach

Stepp (1936) Schroeder (1936) and Einhauser (1936) claim that certain bacteria especially *B coli communis* may cause destruction of the vitamin Marin (1936) reports that orally administered vitamin failed to cure a case of scurvy in which *B coli* and paratyphoid B organisms were present in the intestinal tract

In the same way that anaemia is often found in association with various disturbances of intestinal function so are deficiency states commonly associated with gastro-intestinal disease Mackie and Pound (1935) for example found evidence of deficiency states in 63 per cent of seventy-five cases of chronic ulcerative colitis although a history of a defective dietary was seldom elicited—I am, etc,

National Food Policy

SIR,—I was only a little less astonished at the contents of the special report Towards a National Food Policy, than I was at the commendatory terms in which it is referred to in the *Journal* of July 16 (p 141) Rarely can one have seen sponsored as it is such an inconsequent *melange* of mutually contradictory suggestions One suggestion however, appears to have been placed in the forefront and as from the context we may suppose that it is regarded as a serious constructive effort I propose to single it out for discussion On page 5 of the circular the following statement occurs Our argument is that basic food should be taken deliberately out of the normal field of supply and demand in that food is a primary necessity and must be guaranteed inalienably to all

The law of supply and demand is a law of Nature as inexorable as the law of gravity Treating the matter more seriously than it deserves however let us try to find out how exactly it is proposed to realize this aspiration On page 5 it is suggested that boards should be established to handle the whole distribution of food from the point of production or import to the home of the consumer Clearly this implies that these boards will be the purchasers of the foodstuffs How demand in the form of the mouths of the populace to be filled and supply in the shape of competing home colonial and foreign sources are to be brushed aside and ignored is not and indeed never can be clear It is possible that owing to its general indefiniteness there may lurk somewhere in this circular something that may be construed as a suggestion such as has indeed been made elsewhere by one of the signatories that foreign competition should be excluded and that by means of a Government grant to the undernourished food stuffs should be purchased from the home farmer thus at one blow according to the original proposer setting the farmer on his feet doing away with undernutrition and encouraging trade If such a suggestion exists apart from pointing out the difficulties in getting the undernourished to spend this extra money in the way desired I am content to leave it to be dealt with by the arguments employed by the Prime Minister in his Kettering speech of July 2

Fortunately in the interests of space this subject need not be pursued further, nor need attention be given to the related proposals for dealing with the distributor and middleman for it has to be stated that strange as it may appear the real crux of the case has entirely escaped the notice of the committee against malnutrition Their proposals as just outlined it has to be emphasized contemplate interference with the food supply of each and every individual in the nation Let us therefore examine what necessity there exists for such a procedure

It has been stated that 50 per cent of the population of this country are in a state of undernutrition On the evidence submitted by the author of this statement it is impossible for anybody to believe it nor is there anything to show even if *such undernutrition did exist that it could be attributed to lack* of food and not to other conditions which everybody knows are active in producing undernutrition Further even if undernutrition to the degree alleged existed and even if it were due to lack of food nobody can believe that in the majority of cases it is caused by an actual lack of money wherewith to buy food Money is often through ignorance misspent in buying the wrong type of food or in purchasing what under the circumstances can only be termed luxuries

It would seem therefore that of the population there is only a certain minority small in proportion to the whole whose state of undernutrition may justifiably be attributed to actual lack of money wherewith to buy food To suggest that the food supply of the whole nation should be turned upside down and subjected to control under the ill considered scheme here suggested in the interests of this minority is as if one were to contemplate the burning down of a palace in order to fry an egg

The irony of the situation is that there is not, and never has been, any need for the mental agonizings of committees formed or forming themselves for the purpose of finding a solution As I have pointed out elsewhere, and as must have been obvious to everybody for decades we have the precedent and practice of hundreds of years standing in the shape of public dispensaries for providing medical and other help to those unable to afford such The matter appears so simple and common sense that I have the greatest hesitation in elaborating it Briefly stores—Government and otherwise—could be established in poorer districts in which foodstuffs purchased wholesale in large quantities to effect an economy could be sold (or in some cases given away) to those unable through lack of means to buy them in the ordinary way By such means the expenses and profits of the distributor and middleman could be largely eliminated and such places could under the direction of say the medical officer of health not only serve the purpose of giving advice to individual purchasers as to the best manner of expending the money available but also act as centres for the dissemination of correct ideas regarding the purchase utilization etc of foodstuffs The latter activity, be it said in parenthesis is apparently the only practicable method of dealing with the group who having money to spend spend it so unwisely as to lack suitable food

Moreover with the experience of the parent institutions as a guide the scheme could be put into practice forthwith and function practically from its inception—a situation vastly different from that envisaged on page 1 of the circular It is doubtful whether dietary surveys owing to the intrinsic nature of the subject will ever produce anything of academic interest even to the ethnologist not to speak of the practising nutritionist Time and money it would seem could be employed more usefully in carrying out practical schemes such as the one just outlined—I am etc.,

J P MCGOVERN
Aberdeen July 19

Antimony Therapy

SIR,—Drs Hans Schmidt and F M Peter are to be congratulated on their English edition of *Advances in the Therapeutics of Antimony* which may well be compared with what is included in Dr G M Findlay and C M Wenyon's *Recent Advances in Chemotherapy* Unfortunately the report states on page 112 that the first patient to receive the tartar emetic treatment was not cured, though Dr J B Christopherson[1] recorded absence of ova and a negative antigen reaction Difficulty in obtaining evidence of cure is specially difficult in *japonicum* infection and for this reason the advocation of proprietary remedies in place of tartar emetic must be taken with caution

I have recently had the opportunity of observing a gradual increase of degenerative changes in the ova of *Schistosomum mansoni* which was the only type present in the urine of a little schoolboy of 11 whilst undergoing treatment with anthiomaline I observed between forty and fifty of these ova during treatment Four months later, though no symptoms of infection were detected I observed one ovum of *Schistosomum haematobium* thus confirming a report from the Natal Pathological Laboratory of mixed infection some months before I had seen the case This suggested that a total of only 30½ c cm in twenty-seven days had been insufficient to effect a cure of this patient, thus confirming the opinion that it is seldom wise to discontinue treatment before the twenty-eighth day—I am, etc,

Durban South Africa, July 11 F G CAWSTON

Small-pox and Compulsory Vaccination

SIR—I am indebted to Dr C Killick Millard for the information contained in his letter (*Journal* July 16 (p 151) I admit ignorance of the current views among those most familiar with the questions of the aetiology and prophylaxis of small-pox, and his letter was therefore enlightening perhaps to some others as well as myself I should be interested to hear to what informed opinion does attribute the decline of small-pox in this country, is it considered to be naturally dying out? Most of us have heard the opinion expressed that the repealing of compulsory vaccination might expose the next generation to a severe epidemic of the disease Having recently witnessed the effects of a severe epidemic in a country in which small-pox is endemic perhaps I may be pardoned for feeling that we should be absolutely confident of the results before abolishing compulsory vaccination and those who advocate it must presumably have a sound basis for their confidence

The fact that Leicester, where compulsory vaccination was abandoned over fifty years ago, has had such a fortunate experience is perhaps not such a convincing criterion as a similar experience might be in a city like Liverpool, where exposure to infection is presumably greater Has the experiment of abolition been tried in this city or in any other large port? It would appear on the surface that Leicester's experience might be misleading in that compulsory vaccination may have been responsible for a reduction in the incidence of infection from which the whole country including unvaccinated areas might have benefited I was chiefly concerned in my previous letter with the question of compulsory diphtheria immunization and if it was somewhat startling to hear from Dr Killick Millard that both the Association of County Medical Officers of Health and the Society of Medical Officers of Health have passed resolutions in favour of the abolition of compulsory vaccination at least it would be interesting to know whether they would recommend its replacement by compulsory diphtheria immunization—I am, etc,

London, W 12, July 21 A L CRADDOCK

The Cancer Campaign

SIR—Are we conducting the cancer campaign aright? Judging by the meagre results obtained the question can hardly be answered in the affirmative Great efforts are being made to discover the cause but, as Mr Hastings Gilford in his thoughtful letter (*Journal* July 2, p 41)—one of the best I have seen—points out, already many of the causes are known, to which may be added tertiary syphilis, especially of the mouth also lupus Mr Lockhart-Mummery (*Surg Gynec Obstet* 1938, **66** 2?1) considers that the condition is bound up with eugenics which, in my humble opinion, is a very promising field of research, enabling tainted stock to be watched carefully for early manifestations, though marriage on eugenistic grounds is a far cry I understand that negroes are much less liable to the disease than the white and yellow races so that a guess may be hazarded that civilization is a factor It would appear that cancer tends to attack the previously healthy rather than those stricken with other disease, but this is unproven

Like Mr Gilford, I think that possibly a cure may be found, as witness the striking successes of sulphanilamide in the treatment of streptococcal infections It is not right to discourage research work on these lines One solid rock of truth stands out in this sea of mystery—the fact that *the knife can cure in the early stages* Admittedly this is a crude weapon, but its results compare favourably with those of radium and x-ray therapy which likewise demand early diagnosis

To my mind the most obvious method of attack is the dissemination of knowledge already possessed regarding the early symptoms and the discovery of new ones Nowhere is this called for more than in the case of the commonest of all—gastric cancer Lord Moynihan used to teach that the symptoms of carcinoma of the stomach were loss of interest in life loss of appetite, loss of blood (anaemia) to which may be added loss of abdominal comfort due to meteorism in a patient of previous good health Now he would be a bold surgeon who would operate for these symptoms, but fortunately we have radiology to clinch the diagnosis At the very onset the stomach becomes lazy peristaltic waves are few, and pictures taken at intervals present the same pattern I have diagnosed a cancer 1 cm in diameter on this finding alone The peristaltic waves may be constantly arrested at a particular point, proving destruction of musculature often by malignant disease An ulcer of large dimensions is suggestive A patent pylorus, permitting the continuous entry of barium into the duodenum, means destruction of the sphincter A small stomach with obstruction signifies malignant disease (L A Rowden) Localized disappearance of the mucosal rugae indicates cancer

All these signs appear long before the classical symptoms occur Let us examine these symptoms *Vomiting* This occurs with a number of gastric and extragastric conditions *Coffee-ground vomit* The "grounds" represent blood altered by long contact with the gastric juice, not necessarily due to cancer *Tumour formation* This is of the utmost value when present, unfortunately the commonest cancers do not produce palpable growths

[1] Christopherson J B *British Medical Journal* October 8 1921, p 551

Cachexia But surely this is a sign of hopelessness as is Virchow's gland at the termination of the thoracic duct Thus it is apparent that carcinoma of the stomach in its operable stage is diagnosable by x rays long before classical signs and symptoms manifest themselves Similarly oesophageal and colonic—not including rectal—cancers are diagnosed with greater ease and accuracy with x rays than clinically Renal pelvic growths lend themselves well to this form of diagnosis as do cerebral growths Consecutive films reveal bronchial carcinoma long before clinical signs are present

My idea of a cancer campaign would be the wholesale education of the profession in clinical as distinct from technical radiology This would be attained by the establishment of an x ray museum on the lines indicated previously (*Journal* 1937 2, 1054) a place where men could wander imbibing knowledge as they can in that magnificent display of the Pathology of the Living the Wellcome Museum of Medical Science organized by Dr Daukes It would be supplemented by short intensive courses of demonstrations I do not agree with Dr Douglas Webster that the difficulty would be in finding a curator Provided adequate remuneration was available many men could be found Money is being poured out on apparatus all over the country with scant justification judging by some of the results in bone radiology yet no one seems to realize what a tremendous help a museum would be I believe with Dr Webster (*Journal* 1937 2 1152) that a long time would be necessary Rome was not built in a day but on one particular day it was started The museum would never be complete, but therein would lie its fascination I agree with Dr Webster that a suitable resting place should be found for apparatus which has represented stepping stones in the development of the beautiful apparatus of to day — I am etc,

London W 1 July 20 A P BEPTWISTLE F R C S Ed

Subvesical Diathermy Prostatectomy

SIR,—The short article on subvesical diathermy prostatectomy in the *Journal* of July 23 (p 175) by Mr R Ogier Ward raises some points which appear to call for comment The perurethral operation as he rightly says is now firmly established as a *therapeutic measure of the greatest use* in urological surgery Mr Ward in advocating his subvesical operation claims that in the ordinary resection operation a large portion of the trigone sometimes almost up to the ureters is removed If this were so the operation would long have been abandoned extensive resection of the trigone inevitably predisposes to sepsis in the underlying space with serious consequences The operation as carried out to day by urologists versed in this type of operation means virtually a subtotal prostatectomy It has long passed beyond the stage of being a tunnelling or whittling procedure anything from one quarter to four-fifths of the gland is removed The subvesical operation advocated is that which is normally carried out on the subvesical type of gland but where, as is certainly more common there are intravesical projections of the lateral lobes a more radical procedure is manifestly required The removal of a single piece from the region of the posterior commissure followed by intra urethral resection of tissue from the floor and lateral walls as I interpret Mr Ward's recommendation leaves the upper limits of the lateral lobes projecting into the bladder and ideally situated for a ball valve mechanism to come into play at an early date so leading to recurrent obstruction It would to me appear more rational to remove as much of the obstructing tissue as is mechanically possible bearing in mind of course the danger of encroaching too far on to the trigone Familiarity with the operation should guard against this—I am etc

London W 1 July 22 TERENCE MILLIN

Incomplete Descent of the Testicle

SIR — Undescended testicle is not itself a disease but is simply one symptom of a general constitutional disturbance of diencephalo pituitary origin Investigation of the morphology reactivity psychology and biochemistry of such patients if carried out with the precision with which the testicles are palpated points distinctly to this fact Failure to perform this general constitutional investigation is responsible for many mistakes in treatment To attempt surgical correction of undescended testicle without previous correction of the basic constitutional disturbance is contrary to all the rules of contemporary medical practice The assertion made by Mr Denis Browne in his interesting paper (*Journal* July 23 p 168) that pregnyl treatment will not bring down any testis that would not have descended without it is sweeping and goes against the experience of most recent workers on this subject In the first place pregnyl and all other pregnancy urine gonadotropic substances are far from constituting the whole endocrine metabolic treatment of undescended testicle Further, I often see in my everyday practice tragedies resulting from the abandonment of cases of diencephalo pituitary disturbance with undescended testicle to their fate or ultimately to the surgeon without any attempt at early correction by means of general constitutional treatment including endocrinotherapy The disquieting possibilities of hormone treatment mentioned by Mr Denis Browne do not exist when treatment is planned and given by skilful clinicians but tragic certainties assuredly make their appearance when such constitutional disturbances are not sought discovered and corrected in the early years of life I am the first to protest against abuse of hormone treatment but the method is undeniably efficacious provided that the injected hormones are mixed with the commodity used by the great painter in the mingling of his colours—brains—I am etc,

London W 1 July 22 A P CAWADIAS

Cancer of Pharynx and Larynx

SIR —This subject selected for discussion at the recent Annual Meeting of the British Medical Association was well chosen for as Mr Lionel Colledge mentions when opening the discussion from the surgical aspect (*Journal* July 23 p 167) the introduction of irradiation has rendered the problem of treatment in various situations infinitely more complicated This problem of treatment —namely 'surgery *versus* irradiation —is particularly difficult in those early cases of a small cancerous growth limited to the true vocal cord the extremities of the cord being free of disease

In an endeavour to clarify the present position I recorded (*J Otol Laryng* 1937, 52 463) the results which had been obtained at the Manchester Radium Institute following irradiation of intrinsic laryngeal cancer and contrasted them with those following surgical treatment (laryngo fissure) in a similar series of cases collected from my own records and those of my Manchester colleagues This comparative review was restricted to that type of intrinsic laryngeal cancer which was suitable either for surgical treatment or irradiation by the Finzi Harmer technique For comparative purposes I adopted a three

year symptom-free rate, meaning thereby freedom from recurrence during a period of three years or longer

The records showed that of eighteen patients treated by irradiation fourteen (77 8 per cent) were alive without disease (nine for three years two for four years and three for five to six years) while recurrence or continuance of malignancy, occurred in four (22 2 per cent) There was no operative mortality In the surgical group (laryngo-fissure) sixteen patients were treated with an operative mortality of 12 5 per cent and a recurrence rate of 18 7 per cent while eleven (68 7 per cent) survived three years or longer (one for fourteen years one for thirteen years two for eleven years one for six years six for three to five years)

On figures alone it would appear, therefore that treatment by irradiation gives a lower mortality with a greater risk of continuance or recurrence of disease This however, is not 'all the picture, for there can be no doubt that the convalescence in patients treated by irradiation is often most tedious and prolonged, and in my opinion the voice is never quite so good An operative mortality in the recorded surgical group of 12 5 per cent is, I think too high, as is shown by the fact that there was only one post operative death in twelve of my own cases Mr Colledge in his present paper recalls two (8 7 per cent) deaths in twenty-three operations

I think it can still be said that, given a case of limited laryngeal cancer surgery offers the better chance of success, with a slightly higher operative risk but with a quicker and happier convalescence In conclusion, may I congratulate Mr Colledge on his excellent surgical results especially in those cases requiring pharyngotomy or laryngectomy I feel certain it is to be assumed that the cases he records in Table II of his paper fall within the three-year survival rate as mentioned in Table I, though this is not stated May I suggest that confirmation of this point would be most valuable statistically — I am etc,

Manchester July 25 F HOLT DIGGLE

Chemotherapy of Gonorrhoea

SIR —In Colonel Harrison's letter (*Journal*, July 9 p 90) reference is made to the disulphanilamide drug "uleron" and to the technique of its administration in gonorrhoea as practised in the German clinics

Over one hundred Continental publications on this drug have appeared since last July, and these include reports from the leading German university clinics Since that time considerable improvements in end results have been obtained with the drug and it might therefore be of interest if (as an observer and *not* a clinician) I gave a brief outline of what the current practice of administration in Germany is, and of the views held in that country as to the advisability or otherwise of withholding this chemotherapeutic—as recommended by Colonel Harrison—in the early stages of acute gonorrhoea This seems all the more necessary as there appear to be wide differences between the technique of sulphanilamide therapy in England on the one hand and of uleron therapy in Germany on the other

When the latter drug was first introduced immediate application was practised in the acute case and it was given for periods of ten days or more continuously Experience soon showed that gonorrhoea responds to uleron in a few days if it responds at all It was further observed that lengthy administration besides being unnecessary could be harmful The so-called "Stoss method of treatment was therefore adopted—that is, the drug was administered in a maximum of three short bouts of treatment lasting generally, for three to four days apiece and separated by intervals of six days It is now believed that toxic effects—which reference to the literature shows to have included instances, happily rare, of a serious condition (namely, polyneuritis)—can be avoided altogether if this Stoss method of interrupted treatment is employed At the present time the best results in Germany appear to have been obtained by the use of this 'Stoss therapy supplemented by vaccine in certain cases As urethroscopic examinations suggested that many relapses may be due to inflammatory gland foci, urethral dilatation has recently been performed with marked success on the second, fourth and sixth days after the beginning of uleron treatment In brief the rather complicated technique of administration which is now recommended by those responsible for the introduction of uleron into the German clinics and which is based on results reported in publications referred to above is as follows

In the acute cases a three to four day Stoss (totalling 12 grammes) is given at once $KMnO_4$ or weak silver irrigations being started at the same time and continued throughout If at the end of this course smears are negative for gonococci the Stoss is repeated after a six-day pause as a kind of security measure If smears are positive one can either (*a*) repeat the course once or if need be twice after the necessary pause or (*b*) (as practised by Schreuss) give a six day course of vaccine followed by a second course of uleron Tests of cure are done ten to twelve days after the last dose of uleron has been given

As regards the advisability of withholding uleron treatment for three weeks, as advocated by Colonel Harrison opinion in Germany seems to be divided on this point At a recent meeting of the Berliner Medizinische Gesellschaft, Spiethoff, discussing this question, sponsored immediate treatment and quoted as his supporters Schubert Lohe Fuss, and also Bernhard, one reason for this system being the likelihood of complications such as epididymitis and adnexitis occurring during the waiting period On the other hand, Schreuss and Behring's clinic recommend preparatory vaccine treatment prior to application of chemotherapy The former has stated that with early vaccine therapy and uleron administered as from the tenth to the twelfth day he obtained results at least as good as those with the drug administered at the outset Felke quoted by Colonel Harrison, has also emphasized the importance of waiting for three weeks or more before using the drug Opinion is thus divided the balance numerically, being in favour of immediate as opposed to delayed treatment

It is almost trite to say that as treatment with uleron —and even with sulphanilamide—is still in the very early stage of development it is as yet impossible either to lay down hard-and-fast rules for administration or to assess the end-results with any certainty —I am, etc,

London, W 1 July 19 RIPLEY ODDIE

Sulphanilamide in Acute Maxillary Sinusitis

SIR —I have just had experience of a use for sulphanilamide which I thought might be of interest as I have not seen it described so far My patient an adult woman developed acute pain in the antrum and an intense headache on the same side, following a short typical attack of influenza The sinusitis showed all the classical symptoms, with an intermittent temperature of about 101°F The condition was becoming unbearable and she was very reluctant to submit to surgical drainage so, although the causative organisms were not identified, I started her on prontosil album After 4 grammes the first day the pain had decreased 90 per cent and natural drainage became established, she had 3 grammes for two days

following and then 1 5 grammes for another two days making a total of 13 grammes in five days She experienced slight nausea throughout but no other disadvantages and she avoided surgical treatment which pleased her greatly Drainage is still free but the discharge is decreasing steadily, and the patient feels well and is about her household duties —I am, etc,

Rangeon July 18 J SHANKS LAURIE

Sulphonamide for Epilepsy

SIR —The following notes on the action of sulphonamide in a case of old standing epilepsy may stimulate interest in trying out this drug

A boy aged 11¼ years physically sound with no family history of epilepsy at the age of 4¼ years had major fits once a month for six months He had no fits for two years then a bad fit followed by coma lasting one week He improved and had only occasional attacks of petit mal till four years ago, when he came under my supervision For the last three years he has averaged six attacks of petit mal a day and two to three major fits a week His mental development was normal till 1934 since when it has gradually deteriorated All sources of reflex irritation were dealt with and in December 1937 he was completely investigated in hospital Ventriculography showed no focal damage Encephalograms showed enlargement of the ventricular system explained by widespread cerebral atrophy

During the last four years ketogenic diet prominal luminal and bromides have been tried—prominal and luminal in small, moderate and large doses There was no improvement in the number of fits or in the deterioration of the mental condition

In despair 7½ grains of sulphonamide were given thrice daily In three days the boy ceased having either major or minor fits but was very restless and had night terrors The sulphonamide was stopped at the end of a week and two days later he had two major fits which recurred each day Treatment with sulphonamide (15 grains t d s) was re instituted after a week's interval (and is still being continued under observation for toxic symptoms) The boy has had no fits of any kind from two days after re instituting the sulphonamide treatment (fourteen days ago)

The boy's mental condition shows definite improvement He is having no sedatives and is on a normal diet and regime After four years of depressing results with cerebral sedatives the action of the sulphonamide appears nothing short of miraculous —I am etc

J C YEOMAN MB BS

Cullercoats Whitley Bay July 20

Complications of Gold Therapy

SIR —Any who wish can prove for themselves the truths contained in the letter from Dr H Warren Crowe *Journal* July 2, p 44) Since 1930 suitable cases of rheumatic disease have been treated at the Royal Portsmouth Hospital with small doses of the vaccines advised by Dr Warren Crowe and the claims advanced for this treatment have many times been substantiated For the last two years or so vaccine resistant cases—a small minority when correct doses are employed and the doses are properly spaced—have been given intramuscular injections of gold The doses have often been as small as those given at the Charterhouse Clinic and the results seemingly have run parallel with those of that clinic, no toxic symptoms have occurred Home exercises insisted on from the first attendance are of the greatest value When the disease has become less active physiotherapy and/or manipulation are combined with injection treatment

My colleague Dr R S MacHardy treats cases of arthritis, preferably those of the rheumatoid type, with low voltage x rays (60 to 90 kV) He gives a first dose of 80 *r* units on not more than two joints His aim is to get a slight local reaction within forty-eight hours as evidenced by some increase of pain and heat in those joints Should the reaction not appear he halves the dose at the next visit when the desired reaction is likely to occur unless the dose is still too large This technique is a further example of the value of small doses in the treatment of rheumatic disease Though quick local improvement is aimed at when vaccines and gold are employed rather than the slight local reaction which follows the use of the small doses of x rays both methods produce a definite improvement in the patient's general health in a short time —I am etc

Southsea, July 11 H FARNCOMBE

SIR —Our researches at the Charterhouse Rheumatism Clinic have demonstrated that the differential sedimentation test,[1] which is an elaboration of the blood sedimentation rate supplies just that method for which Dr J B Bennett (*Journal* July 16 p 152) and his collaborators at Bath are searching From its indications we have been able to decide which cases are suitable for gold and, after the first determine the proper size of subsequent doses Further, the test gives adequate warning of the approach of toxic reactions

I gather that Dr Slot (*Journal* July 16 p 152) must have tried the small-dose method following a letter of mine in the *Lancet* (1937 2 990) but possibly the last paragraph of that letter escaped his notice for here I ventured to claim that the direct result of gold was like that of vaccine—an immunity response The two methods vaccine therapy and chrysotherapy would thus be complementary and not as Dr Slot says, based on entirely different conceptions of therapy

The opinion of Koppenhofer is that gold acts as a catalytic stimulator to the reticulo-endothelial system He showed that when a colloidal gold salt is injected it finds its way immediately into the cells of an inflammatory area where it is reduced to the metal or the simple sulphide If this view is correct there does not seem to be any obvious necessity for the more complicated gold salts Experience at the Charterhouse Rheumatism Clinic tends to confirm Koppenhofer's views of the action of gold, as at present we are using with quite appreciable success a simple colloid emulsion of gold sulphide, prepared for us by British Colloids in doses up to a maximum of 2 5 mg

I understand it to be a principle of the chemistry of catalysts that the optimum concentration is rarely the largest tolerable and quite commonly it is an extremely small quantity Since we find that we are able to obtain both the desired clinical and biochemical effects which we seek by using gold in these small doses at long intervals there seems no sound reason for following blindly the manufacturers posological tables into the regions of hundreds of milligrammes and toxic reactions

It must be understood that we only use gold in that small proportion of cases which show extreme sensitiveness to vaccine but that is because in the majority of cases vaccines give as good results as can be expected

I do feel that it is extremely important for the profession as a whole to decide whether doses of gold are inadequate unless they are large enough to carry the risk of toxic reactions Through these reactions this valuable method is rapidly falling into disrepute One often has the greatest difficulty in persuading an entirely

suitable patient to agree to chrysotherapy The fact is that rheumatic patients are getting increasingly alarmed by the stories of severe illness," of "terrible skin trouble ' of ' gold abscesses which fail to heal for months, and such like I am personally quite convinced that none of these is necessary and that in the great majority of suitable cases (those showing some degree of hyperergy) subtoxic doses at prolonged intervals are effective—I am etc,

London, W 1 July 25 H WARREN CROWE

Keratoplasty

SIR—Referring to the letter of Mr B W Rycroft in the *Journal* of July 2 (p 43) concerning my case of keratoplasty, I should like to point out that what is seen in the photograph is the apparent position of the rim of the pupil Under normal conditions the pupil dilates up to a diameter of 4 mm, whereas the trephine used to prepare the graft was 4 63 mm in diameter It is well known that the usual results of optical iridectomy are disappointing Regarding the duration of the transparency of a graft I quoted in my paper the observations of those who have had considerable experience in corneal grafting—for example, Filatov—I am, etc

Medico-Legal

THE BOURNE CASE A LEGAL VIEWPOINT

[BY A BARRISTER]

So far as the ethical and social aspects of the Bourne case were concerned probably everyone, except those who adopt the extreme view, on religious grounds that abortion is never justified, was glad that Mr Bourne was acquitted Looking at the matter, however, from a purely impersonal standpoint as a member of the legal profession, it is rather to be regretted that there was not a formal conviction and a nominal sentence of one day, in order that the law might be discussed in the Court of Criminal Appeal and possibly even in the House of Lords, if the Attorney-General's *fiat* could have been obtained to take the case there as involving 'a question of law of exceptional public importance For it is no disrespect to the judge to say—and he would certainly admit it—that no summing-up to a jury, however careful, fair and accurate carries the same weight of authority as the deliberate pronouncement of an appellate tribunal Strictly speaking indeed the opinion expressed in the summing-up is not binding on other judges of co-ordinate jurisdiction though they would be reluctant to differ from it But the fact remains that it is still open to any other judge to say 'I have carefully considered the statement of the law by Mr Justice Macnaghten in Rex v Bourne, but with the utmost respect to the learned judge I do not agree with his view and am not prepared to follow it ' And the rival view might be more rigid or more liberal than that of Mr Justice Macnaghten Whereas if the case could have been taken higher the decision of the Court of Criminal Appeal would have bound all judges of first instance until either the House of Lords overruled it or Parliament dealt with the position by statute

Abortion, Lawful and Unlawful

The general opinion of the legal profession seems to be that as the law stands Mr Justice Macnaghten's ruling was right erring if at all on the side of rigidity No doubt exists that abortion to save the mother's life is lawful, few will doubt that it was correct to extend that to include the prevention of serious or permanent injury to her health, some would go further No definition these would say, has been laid down by Parliament of "lawful ' or "unlawful in this connexion The saving of life is admittedly an example of that which is lawful, but is there any authority for saying that it is the sole and exclusive example and that there cannot be other circumstances of sufficient gravity to render abortion lawful? Among such possible alternative grounds they would probably be willing to include the desirability of terminating a pregnancy resulting from a criminal assault on a girl under the age of consent and possibly any pregnancy resulting from a criminal assault whatever the age of the expectant mother Such a view might well be based on the intolerable position of a mother whose child, by its very existence was a continual reminder of the ordeal to which she had been subjected, to say nothing of the undesirability of bringing her into further contact with the assailant over questions of maintenance, which would probably arise if the child were born As to this, one may observe in passing that, while something more than the expectant mother's mere assertion that she has been assaulted is obviously required something less than the conviction of the assailant ought to suffice, since there may well be cases where the fact of an assault is not in doubt but where the identity of the culprit is never established Apart from a conviction therefore, if this ground of abortion were allowed adequate medical or other evidence should be accepted

There is a certain amount of inferential evidence to support this more extended and liberal view of the law It is only within recent years that Parliament has raised the minimum age of marriage to sixteen, from which one may conclude that it was thought that motherhood even in wedlock ought not to be permitted below that age and that pregnancy in a girl under sixteen must always and in all cases result from a crime In the Infant Life (Preservation) Act, 1929 which created the specific offence of child destruction it was expressly enacted that to kill a child *capable of being born alive* should be felony unless it was done for the purpose only of preserving the life of the mother This appears (*a*) to draw a distinction between abortion after the child is viable and abortion at an earlier stage and (*b*) to imply that at the earlier stage some other causes may justify abortion for otherwise this express restriction with regard to the later stage seems wholly superfluous

Difficulty in Framing a Definition

When one considers possible reform of the law to make more explicit the circumstances in which abortion should be lawful, one is faced with the usual difficulty in framing a definition which will not, on the one hand, let in too much and make abortion easy for any unwilling mother or on the other hand, shut out some cases which a humane and conscientious surgeon would desire to include No is reliance on a second opinion even if it were given statutory, as distinct from professional and customary recognition, a wholly satisfactory safeguard against improper interference with pregnancy

I have more than once heard it stated—with what truth your medical readers will be better able to judge than I—that a woman provided with sufficient funds can easily get an illegal operation performed with all the appurtenances of respectability provided she goes to the right man (or men) The very existence of such a "racket" may be apocryphal one would certainly not suggest that it is widespread but the fact that it is obviously possible minimizes considerably the value of the protection afforded to the honest surgeon by a second or third opinion

It has been suggested that a solution of the problem might be found in legislation on the following lines

(*a*) Abortion to be an offence in any circumstances if performed by anyone other than a registered medical practitioner

(b) An obstetric board of say seven eminent gynaecologists to be set up The method of nomination of such a board is obviously a matter for the medical profession not for a lawyer to suggest The board to have power to act by a panel of not less than three (This provision is necessary to prevent the possibility of a member being called on to adjudicate on a case of his own) It would probably be necessary to appoint regional boards in a number of large towns to prevent patients having to come long distances for examination

(c) Any medical practitioner to be at liberty to refer to the board any case in which he considered that abortion ought to be allowed on any ground and the board after examining the patient and considering all the circumstances of the case including the mother's health the probability of good or bad heredity for the child and any special ethical or social problems arising out of the case to have power to permit or refuse abortion

(d) Abortion without the board's permit to be unlawful except in cases of immediate urgency in which case a full report on the circumstances should be furnished forthwith to the board by the surgeon

(e) A reasonable fee to be paid for the board's examination and certificate by those who can afford it hospital cases to be given it as part of the hospital service

If such legislation were introduced the opportunity might perhaps be taken to overhaul and bring into line with modern thought and knowledge the whole criminal law with regard to sexual offences

MA, BCL

UNSUSTAINED CHARGE OF NEGLIGENCE

On July 21 without leaving the box a special jury at Leeds Assizes returned a verdict for Dr Florence Slade in an action against her for alleged negligence in the course of attendance upon a young married woman in her first pregnancy Mrs Isabella Mary Lloyd Hughes sued to recover damages from Dr Slade and Trevor Lloyd Hughes her husband of Headingley an insurance official claimed for out of pocket expenses incurred as a result of the alleged negligence Dr Slade denied negligence and counter claimed for her fees against the husband Mr G H B Streatfield K C for the plaintiffs submitted that complications were discovered by another doctor after some lapse of time and the result was that Mrs Lloyd Hughes had to undergo a much more serious operation than otherwise would have been required The defence called Mr Carlton Oldfield consulting gynaecological surgeon to the General Infirmary at Leeds who said that there was no one symptom in the case which should have induced Dr Slade to suppose that everything was not perfectly normal Judgment was entered for the defendant with costs on both the claim and the counter-claim for fee

DEATHS IN THE SERVICES

Colonel ALEXANDER FRASER RUSSELL C M G late R A M C died at a nursing home in Edinburgh on June 12 aged 81 He was born at Kilmodan Argyllshire on December 21 1856 and was educated at Edinburgh University where he graduated M A in 1877 and M B C M in 1881 Entering the Army as a surgeon on February 5 1882 he attained the rank of colonel on November 2 1911 and retired on December 21 1913 He served throughout the South African War of 1899 to 1902 when he took part in the relief of Kimberley and in operations in the Transvaal Orange Free State Zululand and Cape Colony and was present in the actions at Paardeberg Poplar Grove Dreifontein Karee Siding Zand River Johannesburg Pretoria and Diamond Hill He was mentioned in dispatches in the *London Gazette* of April 16 1901 and received the Queen's Medal with six clasps the King's Medal with two clasps and the C M G He rejoined for service during the war of 1914–18 throughout which he served as A D M S on Salisbury Plain

Obituary

CHARLES H H HAROLD O B E M D D P H.

Lieutenant-Colonel R.A.M.C. (ret.) Director of Water Examination Metropolitan Water Board

We announce with great regret the sudden death on July 18 of Colonel Charles Harold who succeeded the late Sir Alexander Houston as Director of Water Examination Metropolitan Water Board in March 1934 Only a fortnight ago at Plymouth he was re-elected for the third time to represent the Royal Army Medical Corps upon the Council of the British Medical Association

Charles Henry Hasler Harold was born on January 1 1885 and studied medicine at Liverpool University graduating M B Ch B with honours in 1907 after which he spent two years in house appointments at the Liverpool Royal Infirmary He was elected Holt Fellow of the University in 1909 and in the following year took his M D degree and joined the R A M C as a lieutenant, winning the Tulloch Memorial Medal and the Ranald Marten Medal After several years service in India he was promoted captain in 1914 while at Dagshai During the war he served with the Indian Expeditionary Force in Mesopotamia and with the Marri Punitive Expedition in 1918, for his services in East Persia and Afghanistan 1918–20 he was mentioned in dispatches and promoted brevet major He had been D A D M S (San) of the 3rd Lahore Division and on the Lines of Communication East Persia and sanitary adviser to the Forces in Transcaspia In 1921 he was made instructor at the Army School of Hygiene Aldershot and five years later Assistant Director of Hygiene and Pathology Northern Command India His last military post was that of Assistant Director of Hygiene Southern Command England and he retired from the Service in 1924 with the rank of brevet lieutenant-colonel on taking up the important duty of watching over the purity of the water supply of the Metropolis Colonel Harold's presence in London gave the British Medical Association an opportunity to profit by his knowledge and sound judgment at headquarters In 1935 he was appointed to the Naval and Military Committee and elected to the Council as representative of the R A M C he was also a member of the Subcommittee on Terms and Conditions of Service of Civilian Medical Practice

After graduation at Liverpool he published jointly in the *Journal of Physiology* a paper on the influence of the presence and position of various radicles of adrenaline on its physiological activity he also wrote on his war experiences with tick fever in East Persia on the breeding of *Anopheles maculipennis* in captivity and on mosquito bionomics A contribution to the *Journal of State Medicine* in 1925 on sterilization of water by chlorine and some of its compounds had been preceded by a paper on the chloramine treatment of water in the field and these foreshadowed the nature of his future line of work The two annual reports bearing Harold's

signature on the results of chemical and bacteriological examination of the London waters were lucid and informative documents lacking only the picturesque touch that readers had looked for year by year in the writings of Alexander Houston Under Harold the high standard of purity of the water supplied by the M W B was fully maintained It is said to think that death has prevented him from continuing his valuable career in the large new chemical and bacteriological laboratories at New River Head He was a man of the most kindly and approachable disposition

[The photograph reproduced is by Lafayette London]

The death of Dr ANDREW WILLIAM THOMSON of Jamaica which occurred on May 30 was mourned throughout the parish of Clarendon Born on December 29, 1868 he pursued his medical studies at the University of Aberdeen graduating M B C M in 1892 and returning home entered the Government Medical Service in the same year His first appointment was acting district medical officer at May Pen in the parish of Clarendon Soon however he was transferred to Stony Hill and later to Falmouth and it was not until 1902 that he returned to Clarendon where as district medical officer at Chapelton he was to serve the community faithfully until his death For forty six years Dr Thomson was an active member of the Jamaica Branch of the British Medical Association, and in 1932 his colleagues showed their esteem by electing him to the office of president In more recent years he was forced by ill health to curtail his activities but his interest in Branch affairs never abated In municipal life any scheme for the improvement of the lot of the working man was assured of his whole hearted support and despite the continuous pressure of a very large practice he still found it possible to give much time even in his busiest years to this cause Loyal to his colleagues sympathetic with his patients and courteous to all he won the esteem and affection of all with whom he came in contact The profession is the poorer for his passing

The death of Dr DAVID LAURENCE TATE which occurred early in June robbed the parish of St James Jamaica of one of its outstanding personalities Although his health had been failing for some time his sudden death came as a shock to his many friends throughout the island He studied medicine at Glasgow graduating M B Ch B Glas in 1906 and taking the F R C S Ed in 1918 A very able surgeon and keenly interested in his profession Laurence Tate was incapable of sparing himself His early years in the Government Medical Service were spent in the parish of St Mary whence he was transferred to Montego Bay where as district medical officer he served zealously until his retirement a few years ago In 1908 he became a member of the British Medical Association and to the end he maintained a lively interest in the activities of the Jamaica Branch particularly in medico political problems To his sorrowing widow and daughters the Branch tenders its sincere sympathy

Dr WILLIAM CLAUGHTON DOUGLASS who died at Stanmore Middlesex on July 7 was for many years a keen worker in electrotherapy and x-ray diagnosis He studied medicine at St Bartholomew's Hospital and qualified M R C S L R C P in 1900 During the war he attained the rank of major R A M C and won the Military Cross He had been clinical assistant in the x-ray and electrotherapeutic departments at St Bartholomew's medical superintendent of Clare Hall small pox hospital and medical director of the Comely Bank electrotherapeutic clinic at Walthamstow He obtained the Cambridge D M R T in 1926 and in recent years held the posts of assistant medical officer in the x-ray and electrotherapeutic department of the Metropolitan Hospital and medical officer in charge of the electrotherapeutic and light departments at the Connaught Hospital Waltham Stow Dr Douglass published a small work *The Elements of Medical High Frequency and Diathermy* in 1930 and wrote several papers on his specialty He had been a member of the Harrow Division of the British Medical Association for the past ten years

Dr CHARLES R DICKSON who introduced x rays to the Toronto General Hospital and, after losing his sight through exposure to the rays founded in 1914 the Canadian Institute for the Blind, died at Toronto on July 9

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A quarterly Council meeting of the Royal College of Surgeons of England was held on July 14 with the President Sir Cuthbert Wallace in the chair

Mr Hugh Lett was elected President Professor G. Grey Turner was re-elected Vice President and Mr R. F. Kelly was elected Vice President for the ensuing year

Mr Victor Bonney Mr R. C. Elmslie and Sir William Girling Ball were readmitted and Mr I. F. C. Norbury was admitted to the Council

Dr Mahmud Bayumi Bey (Cairo) was admitted to the Fellowship of the College having been elected in April last

The congratulations of the Council were expressed to Mr Cecil P. G. Wakeley and Professor A. St G. Huggett who have been awarded the Insignia of Officer of the Order of the Nile (Third Class) and to Mr Horace H. Rew Director of Examinations of the College who had been awarded the Insignia of Officer of the Order of the Nile (Fourth Class) after the Primary Examination for the Fellowship conducted in January of this year

Lecturers

The following lecturers were appointed for the ensuing year

Hunterian Professors—Mr George Armitage one lecture on Gastric Operative Observations on the Healing of Chronic Gastric Ulcer Miss Dorothy J. Collier one lecture on Facial Paralysis and its Operative Treatment Mr A. I. d'Abreu one lecture on Congenital Cysts of the Lung and Pleura Mr I. R. Edwards one lecture on Studies in Experimental Pneumonectomy and the Development of a Two-stage Operation for the Removal of a Whole Lung Mr A. J. Gardham one lecture on Surgery of Carcinoma of the Mouth and the Tongue Mr I. J. S. Gower one lecture on Pulmonary Tuberculous Post-operative Complications and their Prevention A Clinical and Experimental Investigation Mr C. A. Joll one lecture on the Pathology Diagnosis and Treatment of Lymphadenoid Goitre (Hashimoto Lymphogranuloma) Mr J. H. Mulvany one lecture on Differentiation in the Mechanism Symptomatology Pathology and Treatment of the Two Types of Exophthalmos associated with Graves's Disease and a Short Account of their Probable Pathogenesis Mr D. W. G. Murray one lecture on Heparin in Thrombosis Mr E. W. Riches one lecture on Hydrocephalus The Results of Conservative Treatment Professor J. Pierson Ross one lecture on the Effects of Radium upon Carcinoma of the Breast Mr H. T. Simmons one lecture on Relapse following Sympathectomy

Arris and Gale Lecturer—Dr John Beattie three lectures on subjects relating to Human Anatomy and Physiology

Erasmus Wilson Demonstrators—Mr R. St I. Brockman one demonstration on Some Inflammatory Lesions of the Alimentary Canal Mr R. Davies-Colley one demonstration on the Pathological Contents of the Museum Mr I. W. Proger four demonstrations on the Pathological Contents of the Museum

Arnott Demonstrator—Mr A. J. I. Cave six demonstrations on the Contents of the Museum

The Hallett Prize was awarded to Howard Hadfield Fddey of the University of Melbourne and the ninth Macloghlin Scholarship to Frank Bailey of Oldham Hulme Grammar School

The new regulations for the Licence in Dental Surgery which will become effective gradually as from October 1 were approved and the Council agreed to a recommendation that a Postgraduate Diploma in Dental Surgery should be instituted

The Council appointed Professor R. J. S. McDowall (Physiology) and Professor R. Bramble Green (Anatomy) to act as Examiners for the Primary Examination for the Fellowship to be held early in 1939 in Lahore (India) and Cairo (Egypt)

The following reappointments for the ensuing year were approved Mr I. W. Proger Pathological Curator of the Museum Sir Frank Colver Honorary Curator of the Odontological Collection (on the nomination of the Royal Society of Medicine) Mr C. J. S. Thompson Honorary Curator of the Historical Collection

Mr George Kent Harrison (Toronto) was appointed a Leverhulme Scholar for one year from October 1 and Dr David Slome was reappointed a Mackenzie Mackinnon Research Fellow

Diplomas

A Diploma of Membership was granted to Chelliah Ponnambalam (Ceylon) and Diplomas of Fellowship were granted to Edward Philemon Connolly and Louis Julius Horne both of Sydney

Diplomas were granted jointly with the Royal College of Physicians of London as follows

DIPLOMA IN ANAESTHETICS—W. Bourne S. M. Campbell A. L. Flemming P. V. Francis S. Johnston H. J. Shields C. C. Stewart

DIPLOMA IN PUBLIC HEALTH—R. H. Barrett C. Crowley F. R. Glover J. C. Hogarth N. D. Karani Susan MacMahon A. W. McRone J. Marshall B. Roberts C. Seeley C. G. K. Thompson F. W. Vilain

DIPLOMA IN PSYCHOLOGICAL MEDICINE—M. J. Brookes B. Finkleman J. F. R. Goodlad R. K. Grossart C. R. Harris C. Holmes A. A. Huse A. Leitch J. P. McGuinness R. L. Moody R. B. Morton E. K. Mulinder J. E. Saville S. Sharman A. Stoller V. H. Tompkins Betty M. Zeal

DIPLOMA IN LARYNGOLOGY AND OTOLOGY—R. H. B. Bettington B. K. Kapur K. M. Mayall D. G. Phillips I. M. Robertson R. A. Syed R. Thomas

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

The Dr Jessie Macgregor Prize in Medical Science has been awarded to Dr Susanne Jean Paterson for her work on the therapeutic uses of progesterone The value of the prize is £50

BRITISH COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

At the quarterly meeting of the Council held in the College House London W on July 23 with the President Sir Ewen Maclean in the chair the following officers were elected to take office at the October meeting of the Council

President Professor W Fletcher Shaw *Vice Presidents* Professor R W Johnstone Professor Miles H Phillips *Honorary Treasurer* Mr Eardley L Holland *Honorary Librarian* Mr Frederick Roques *Honorary Secretary* Mr G F Gibberd

Medical Notes in Parliament

Both Houses of Parliament were occupied this week in clearing away arrears of business before the Recess which was due to begin on July 29 On the previous day a debate was arranged in the House of Commons on health administration The Parliamentary Medical Committee also arranged to meet before the Recess

Two members of the Parliamentary Medical Committee Sir Francis Fremantle and Dr Haden Guest were able to accept the invitation of the Council of the British Medical Association to attend the Annual Representative Meeting at Plymouth

On July 12 five members of the Parliamentary Medical Committee and two miner M P s were received by Captain Crookshank Secretary for Mines and Sir Alfred Faulkner to discuss rheumatism among coal miners and its treatment The Minister made it plain that his Department would not be interested in a scheme for the general health of the people or with merely experimental work but said that if proposals to be submitted could be shown to be for the treatment of conditions peculiarly affecting miners the Miners Welfare Committee might then be able to interest itself in them He suggested that in the first instance the Miners Health Research Board should be approached Sir Francis Fremantle undertook to convey this suggestion to the Empire Rheumatism Council with whom he is now in touch

The National Health Insurance (Medical Benefits) Regulations (Scotland) 1938 were laid on the table of the House of Commons on July 25

The Report of the Board of Control for 1937 Part I was presented to Parliament on July 26

Lord Horder on Quack Medicine Trade

In the House of Lords on July 26 Lord HORDER called attention to the enormous growth in the quack medicine trade and to the incongruity of exercising no control over the deleterious effects of such trade upon health at a time when strenuous efforts were being made to improve national fitness He also moved for papers He said he had been told that if he had not raised this question he would be charged with having failed to create a monopoly for his own profession and with depriving the poorer classes of cheap cures If there was a monopoly at all in his view with the trade that had the profits of £25 000 000 or £30 000 000 a year—nearly as much as we spent on all our hospital services He was glad to break up a formidable and largely unscrupulous monopoly which judging from the exclusion of patent and proprietary medicines and foods from the Food and Drugs Bill successive Governments seemed almost to go out of their way to guard If the doctor thought only in terms of hard cash he would benefit from this unprincipled trade which eventually brought him more patients, ultimately even the undertaker benefited sooner and oftener than he need Only now was there something better to put in the place of these dubious specifics We had the finest health services in the world The slogan "Use your Health Service was one of the most intelligent he had heard His main reason for pressing the matter at this time was his concern for the success of the national fitness movement For every £100 the Government spent in making the people health-conscious the quack medicine mongers paid £1,000 in making them disease conscious A few patented and proprietary things were good and the claims made for them reasonable a great many did little good or harm and were sold at fantastic prices and now and again something was sold that did definite harm There were an enormous number of preparations that were fraudulent in varying degree The great increase in advertising media was capable of appalling results in its mass suggestion on the country's health and moral The advertisements had become a graver danger than the medicines they served

The debate was continued by Lord ADDISON

Viscount GAGE said that investigation had borne out the fact that improper use of substances in themselves harmless was a distinct danger to the health of the country and hindered the work of the medical profession He was ready to agree that it might constitute an obstacle to national fitness The problem of the dangerous drug had been solved except possibly for new drugs which were being put on the market It had been said that the public were being used as a guinea pig by unscrupulous manufacturers He was informed that there was no method of foretelling the effect of some compounds and that the effects on the human body could only be ascertained by experiment That constituted a positive danger but it was difficult to put absolute restriction on new inventions The majority of the substances were made by firms of the highest repute which in their own interests saw that the precautions taken were very complete

The real difficulty arose from products and substances which were not in themselves harmful but the improper use of which constituted a danger Aspirin used properly provided relief from a number of minor ailments but used to excess it was not beneficial The inherent difficulty in dealing with certain substances was that the real fault lay with the individual who used them If people did not use the immense State assistance medical schemes and preferred to diagnose and treat their own complaints it was largely their own responsibility if they suffered in consequence They were encouraged to do so by very carefully worded advertisements In theory there was a case for controlling the advertisements but it was not easy to design forms of words which could not be evaded He was not attempting to exclude the possibility of some legislation on certain lines suggested but it was difficult to guarantee that it would be effective Repression alone was one of the most dubious of all lines of progress The Minister of Health would examine what Lord Horder had said and see if anything could be done to incorporate in the education aside of the national fitness movement some warning against the abuses of drugs generally Perhaps Lord Horder might still be unconvinced by his reply If so possibly he would like to have a try at legislating himself In regard to publicity matters the Government would be pleased to place all the resources at Lord Horder's disposal but on medical matters they had no higher sources of information than Lord Horder himself commanded The Government's attitude must to some extent at any rate be dictated by public opinion because in these matters the public must have the last word The Government were perfectly prepared to lay any papers for which Lord Horder might wish

Lord HORDER asked leave to withdraw his motion for papers and this was agreed to

Abortion and the Law

Sir HENRY MORRIS JONES on July 25 asked the Minister of Health whether his attention had been directed to the recent acquittal at the hands of the jury of Mr Aleck William Bourne who was charged at the Old Bailey with unlawfully using an instrument with intent to procure the miscarriage of a girl of 14 years and whether as this was a test case he intended introducing legislation to clarify or amend the law dealing with such offences

Dr ELLIOT Yes Sir My attention has been drawn to this case I am not in a position to make any statement pending the issue of a report by the Interdepartmental Committee which is investigating this and other matters concerning abortion

Sir HENRY MORRIS JONES asked if Dr Elliot was aware that during the hearing of this case the defendant stated in evidence before the court that had the subject of the operation been mentally defective he would not have operated and was not defective mentality a case of extreme ill health also?

No answer was given to this question

On July 25 Mr MACNAY asked the Minister of Health if he was prepared to bring in a regulation requiring all members of the medical and nursing professions to certify and notify to the medical officers of health all operations for abortion in view of the fact that such operations differed from others in that the life of another was involved

Dr ELLIOT This is among the matters which are under consideration by the Interdepartmental Committee on Abortion and I am unable to make any statement at the present time

Mr MACNAY In view of the grave concern throughout the country on this matter will the right hon gentleman take care to make representations to the committee to show clearly that this sort of thing is not a private misdemeanour but a deadly national crime?

Dr ELLIOT An influential committee has been considering this for some time and I have no doubt it will take all these matters into consideration

Mr LOCKER I take it that no recommendation will alter the law with regard to murder and the taking of life?

Progress of Bills

The Royal Assent was given on July 13 to the Street Playgrounds Act the Housing (Agricultural Population) (Scotland) Act the Children and Young Persons Act the Baking Industry (Hours of Work) Act the Mental Deficiency Act the Inheritance (Family Provision) Act and other Acts

The Registration of Stillbirths (Scotland) Bill was read a third time in the House of Lords on July 20

On July 21 the House of Lords agreed to the Commons amendments to the Food and Drugs Bill

The Milk (Extension and Amendment) Bill and the Finance Bill were read the third time and passed in the House of Lords on July 25

The following day the Commons amendments to the Young Persons (Employment) Bill were agreed to and the Holidays with Pay Bill passed through Committee

The Annual Report of the Chief Inspector of Factories and Workshops for 1937 was presented to the House of Commons on July 15

A Prohibition of Vivisection on Dogs (Scotland) Bill was introduced into the House of Commons by Mr Mathers on July 26 and was read a first time

Health and Education Services in Scotland

Estimates for the Department of Health Scotland were debated by the House of Commons on July 20 Mr COLVILLE said the period he had to review fell entirely within the term of office of Dr Elliot The House knew the keen interest which Dr Elliot as Secretary of State for Scotland took in health matters These estimates included a new item of £40 000 for grants under the Maternity Services Act passed last year In public health Scotland was going forward It had in the spring the worst influenza epidemic since 1929 yet the general death rate had remained practically the same Infant mortality fell from 82·3 to 80 per 1 000 and the figures for the first quarter of 1938 were still better Most welcome of all was the fall in the maternal mortality rate from 5·6 per 1 000 registered births in 1936 to 4·8 per 1 000 in 1937 The 1937 figure was the lowest recorded in Scotland this century These figures should be an incentive to further effort in which the Maternity Services (Scotland) Act would be of great help The local authorities were pushing on with the preparation of schemes and he hoped that soon every mother in Scotland could secure the services of midwife doctor and if necessary consultant The school health service was working the conception of health into the whole of school life and the 90 000 children who left school yearly in Scotland were fitter than previous generations were The Insurance Act passed last year had enabled the Department to link up the school health service with the insurance medical service and links were being established with the industrial health service under the Factories Act This medical service was given in Scotland by about 2 000 doctors who under a new scheme organized by the Department received opportunities for postgraduate courses Under the Insurance Act it had been found that about two fifths of the total sickness among insured persons was accounted for by those who were ill for more than a year The Department of Health with the co operation of insurance doctors and of the approved societies had begun an investigation of this chronic sickness in such a way as to bring the services of the regional medical officer and the specialist to bear on individual cases In that way they hoped to help the individual case and to discover facts on the handling of chronic sickness generally Other services contributed to the whole health effort For example tuberculin tested cows in Scotland had increased from 20 459 to 70 002 Since the post war housing effort began 290 000 houses of working class type had been built in Scotland 235 000 of them with State aid but 250 000 houses were still needed In the first half of 1937 local authorities completed 5 973 houses in the first half of 1938 9 095 houses Since 1935 the Department had refused to approve the building of houses with less than three apartments but he proposed to authorize the erection of two roomed houses up to the number ascertained to be necessary for old people

Mr TOM JOHNSTON moved a reduction of the vote remarking that 100 000 households in the burghs had no lavatory accommodation Sir ARCHIBALD SINCLAIR said a grant of £50 000 yearly in aid of the statutory health services in the Highlands and Islands had been recommended by the Departmental Committee on the Scottish Health Services and should be implemented

Mr LEONARD spoke of dental defects among school children and suggested that these could be abated by greater attention to the diet of pregnant mothers and younger children He was advised that the Notification of Births Act 1915 would permit local authorities to pay attention to this

After further debate on housing and on water supply Mr WEDDERBURN replied for the Department and the motion to reduce the Vote was defeated by 162 to 111

Medical Examinations of School Children

On July 21 Mr WEDDERBURN moved a Vote for Public Education in Scotland He said that the year 1939–40 would find education authorities generally prepared to make effective provision for the children between 14 and 15 who after September 1 1939 would continue at school There must then be additional accommodation for physical education Considerable progress had been made in providing gymnasia swimming pools and playing fields Continuation classes in physical education were expanding Keep fit classes chiefly for women were successful

In moving a reduction of the Vote Mr WESTWOOD said the school health service had largely fulfilled its purpose of becoming one of the main preventive health services At present children were examined as a routine thrice during school life at entry at age 5, at age 9 and before leaving

school—about age 13 Now that health and education authorities were usually the same age 5 had no special significance and the routine medical examinations could be cut down to two at age 7 and age 13 This would release some of the medical staff for a pre school medical examination to discover defects which should be remedied before the children entered school Mr TOM JOHNSTON said Mr Colville was for the first time giving monetary grants to two Universities—Edinburgh and Glasgow—out of the Education (Scotland) Fund

Mr COLVILLE said 27 per cent of 180 482 children in Glasgow schools received milk free on March 31 1938 It was not necessary that a child should have a medical certificate that it was in need of food before food was provided Many children were provided with food on the report of the head master or teacher

The motion to reduce the Vote was defeated by 171 to 102 and the House went on to discuss the Vote for the Scottish Office On this Mr COLVILLE gave an account of work done under the National Fitness Council He mentioned the expenditure on juvenile welfare and said that he desired to extend the system of probation for adult and juvenile offenders in Scotland

Certification of Criminal Lunatics

Mr NEIL MACLEAN moved a reduction of the Vote and pointed out that in a recent reply to a question in the House it had been stated that a lunatic had been certified by two medical officers of the Department Mr Maclean contended that this was against the intention of an amendment made to the Act passed for the building of a new criminal lunatic prison in Scotland The amendment proposed that one of the persons certifying should not be from the Department but someone from outside preferably a medical man who knew something of the family history of the individual being certified That proposal had been accepted by the Government and the House but he was now told that it only applied to persons likely to be committed to the new Scottish criminal lunatic prison at Carstairs which was not yet completed

Mr CASSELLS said he had been shocked to be told in reply to a question that no instructions had been issued to courts in Scotland concerning the examination of juvenile delinquents by psycho analysts He had merely been told that on every occasion where there was a suspicion of defect or abnormality an examination was to be made

Mr WEDDERBURN replying to the point raised by Mr Maclean said that at Barlinnie and Perth prisons certificates of insanity were normally given by two prison doctors employed at those prisons At Edinburgh prison the certificates were normally given by the prison doctor and by the medical adviser to the Prisons Department At all other prisons the certification was normally by the prison doctor and a doctor independent of the prison service When the Criminal Lunatics (Scotland) Act came into operation on a date to be appointed by the Secretary of State it would remain competent to remove a person from prison to the new criminal lunatic asylum on the certificates of two doctors in the employment of the prison authorities but it would be open to that person or to someone on his behalf to demand that he be examined by an independent doctor Secondly no person could be detained in the criminal lunatic asylum after expiry of his sentence unless a medical certificate was granted by a doctor who was not a salaried officer of the Prisons Department

The motion for reduction of the Vote was rejected by 157 to 98

Divorce in Scotland Bill

The Divorce (Scotland) Bill was read a third time by 77 to 19 in the House of Commons on July 12 Earlier in the sitting at the close of the Report stage the words and nullity of marriage were deleted from the title of the Bill

In the House of Lords on July 19 the Commons amendments to the Bill were agreed to In regard to the deletion of Clause 4 which dealt with nullity Lord Alness said there was a strong feeling in the Scottish Grand Committee against the retention of the clause Its deletion would not affect the main purpose of the Bill which was to reform the law of divorce

Maternal Mortality Rates

On July 12 Mr SANDERS asked the Minister of Health the names of the countries with a lower maternal mortality rate than that of Great Britain Dr ELLIOT in circulating this tabulated statement said that the figures in it except where otherwise shown were for 1935 The comparability of the published rates of maternal mortality was however affected by many factors (for example differences in methods of classification and in completeness of national arrangements for the collection of vital statistics)

Maternal Mortality	*All Causes*	*Rates per 1 000 Live Births*	
Great Britain	4 3	Iceland (1934)	1
England and Wales	4 1	Italy	0
Belgium	4 2	Japan (1934)	2
Denmark	4 0	Netherlands	3 0
Spain	3 4	New Zealand	4
Estonia (1934)	3 4	Norway (1934)	2 9
Finland (1934)	2 7	Sweden (1933)	3 1
France	2 3	Uruguay (1934)	2 3
Hungary (1934)	3 8		

Cost of Health Insurance for Dependants

Dr ELLIOT on July 14 told Mr Graham White that on the assumption that the term dependants was restricted to wives and to children up to the school leaving age the cost of providing medical benefit to the dependants of insured persons would be about £10 000 000 a year if the annual charge per head were the same as that now applicable to insured persons themselves

Medical Examining Bodies

Mr SORENSEN on July 14 asked whether, in view of the multiplicity of examinations and examining bodies relative to the training and professional status of medical practitioners Dr Elliot would consult with the British Medical Association and other medical and surgical organizations about the co ordination and simplification of such training with a view to considering the institution of a State medical examination and establishment of a State medical training hospital Dr ELLIOT replying for the Lord President of the Council said there was no present prospect of the introduction of legislation which would be necessary for this purpose

Medical Refugees

In a reply to Mr Riley on July 14 Sir SAMUEL HOARE said it had always been recognized that a policy of unrestricted admission to this country for qualified doctors or dentists would be out of the question Only a small number of foreign practitioners could be absorbed into the medical and dental professions It would be necessary to select this number with care To assist him in making this selection it was proposed that applications should be examined by a committee on which there would be representatives of the medical and dental professions and of the refugee organizations He was not informed that there was a shortage of medical practitioners in this country

Mr MATHERS asked if Sir Samuel had received intimation of the concern of doctors practising in this country about the numbers already admitted to practice

Sir SAMUEL HOARE said he had had discussions with representatives of the principal medical organizations who agreed with him that discrimination must be exercised The Home Office would be able to admit a limited number and to maintain effective discrimination

Replying to Sir HENRY MORRIS JONES who asked about the admission of medical practitioners of Austrian nationality Sir SAMUEL said he had agreed with representatives of the medical profession that the number of Austrian doctors who could be absorbed into the profession was limited But in deciding on a precise figure he would await further opportunity of ascertaining how many of the applicants possessed special qualifications or special claims to consideration In reviewing applications the Home Office would consider

arrangements the applicant proposed for acquiring the necessary qualification for practising in this country and in what part of the country he proposed to settle It must take into account that as Sir Henry Morris Jones pointed out many of the foreign practitioners were able to practise in this country after a short period of study Sir Samuel added that with co operation between the medical profession the refugee organizations and the Home Office he believed that refuge could be afforded to a number of refugees without flooding the profession in this country with doctors who were not required

Dr SUMMERSKILL said many doctors in this country believed that the Austrian doctors could make a helpful contribution to medical knowledge here

Sir SAMUEL HOARE said that was the fact and showed how necessary it was to deal with the applications case by case on their merits

On July 20 Mr HIGGS put a question which asserted that medical practitioners were very concerned at the intention of the Home Office to admit further alien doctors into this country and allow them to practise here Mr KIRBY on the same day asserted that the medical profession strongly resents their entry and consequent competition with them on a lower standard of training than is required here

Lord WINTERTON referred the questioners to replies previously given to Sir Henry Morris Jones and others

Answering a general question by Mr Riley on July 21 Sir SAMUEL HOARE said traditional hospitality would be extended so far as was compatible with our social and economic conditions to persons obliged to leave their own countries on political racial or religious grounds but individuals who came here must be carefully selected

Nursing Homes Registration in Scotland

Lord Alness in the House of Lords on July 14 moved the second reading of the Nursing Homes Registration (Scotland) Bill which had he said been piloted through the House of Commons by Sir Douglas Thomson Its purpose was to require every nursing home in Scotland to be registered and to make it an offence in that country to carry on a nursing home without registration In Scotland maternity homes had been registrable since 1927 but nursing homes had not been The Bill proposed to repeal the Act of 1927 and to make all nursing homes in Scotland subject to one code as in England to-day This would bring the law of the two countries into complete harmony

The Bill was read a second time without a division

On July 19 the Bill was considered in committee An amendment by Lord Alness to make it clear that a qualified nurse might act as an officer authorized by a local authority to inspect a nursing home was agreed to

Lord Alness moved a new clause giving power to the Department of Health for Scotland to exempt any nursing home carried on in accordance with the practice and principles of Christian Science from the requirement that the home should be in charge of either a registered medical practitioner or a qualified nurse who was or would be resident in the home He said that the clause merely echoed the corresponding provision in the English Statute of 1927 which was re-enacted in the Public Health Act 1936 The new clause was drafted in the Department of Health for Scotland and came before the House with their sanction The clause did not exempt these nursing homes from any of the structural or sanitary requirements which the Board of Health might impose and merely related to the requirements about doctors and nurses The English Act had worked smoothly and well

The new clause was agreed to and the Bill passed through committee

The Bill was read a third time and passed on July 25

Immunization against Diphtheria in Scotland—On July 12 Sir THOMAS MOORE asked the Secretary of State for Scotland what assistance was provided by his department for the immunization of school children against diphtheria and whether in view of the danger of epidemics of this disease, progress in this matter could be accelerated Mr COLVILLE said that the Department of Health had laid stress in their annual reports on the value of immunization of children against diphtheria A number of local authorities with the encouragement of the Department had proceeded with the formulation of schemes for securing such immunization and the Department's medical officers had co operated with medical officers of health to that end

Recall of Patient on Licence—On July 12 Mr LOGAN asked the Minister of Health why a man named Thomas Fisher after being out of Calderstones Institution for five years was recalled and if he was aware that the doctor said he could be considered for release if he had a permanent job

Mr BERNAYS said that the authorities at Calderstones recalled the patient because questions had arisen as to the suitability of the occupation and the adequacy of the supervision available at his home The Board of Control however on June 21 last asked the committee to reconsider the matter and to furnish their observations on the suitability of Mr Fisher for discharge As a result it had been decided to discharge the patient Mr Bernays added that the Minister of Health appreciated Mr Logan's anxiety that patients on licence should not be recalled unnecessarily The Board of Control had in fact issued a circular and the Minister was in communication with the authorities concerned

Somnifaine Narcosis in Dementia—Dr ELLIOT stated on June 14 in reply to Mr Sorensen that it was not proposed to issue a report on the treatment of dementia by somnifaine narcosis The report on cardiazol treatment would be published shortly

Bragg Paul Respirator—Answering a question on July 14 Dr ELLIOT said he knew that a broadcast on July 8 asked listeners whether they knew where a Bragg Paul respirator or iron lung could be found to save the life of a child He regretted a respirator could not be found in this case A certain number of respirators were already available at hospital centres and his medical officers in their visits of inspection were prepared to advise local authorities upon the question of providing them in suitable centres Under the circumstances and having regard to the infrequent occasions on which these appliances were required provision by Government funds of a number of such appliances would not be justified In a supplementary question an assertion was made that there were eighteen such respirators in Great Britain

Rheumatic Fever on a Training Ship—There have been thirty one fresh cases of rheumatic fever amongst the trainees in the *Caledonia* at Rosyth since April 1 last a ratio of approximately 18 per 1 000 strength The sewage arrangements both on board the *Caledonia* and on shore have been under continuous observation by the departments concerned and except for one temporary breakdown against the recurrence of which steps have been taken no deficiency has been reported

Nursing Services Inquiry—The interdepartmental committee on the nursing services hopes to make an interim report before the end of the year It is still hearing evidence

Notes in Brief

A report from the departmental committee on the use of celluloid in the manufacture of toys fancy goods etc was presented to Parliament on July 6

Correspondence relating to the welfare of women in tropical Africa was presented to Parliament on July 5

Replying to Dr Summerskill Sir Samuel Hoare says the removal of women from Holloway Prison to a modern prison outside of London is under consideration

The Scottish Office has recommended to all courts in Scotland that on every occasion where there is suspicion of defect or abnormality a medical and mental examination should be conducted by the most skilful specialist available

No 28

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended July 16 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year, for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and Deaths and of Deaths recorded under each infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

EPIDEMIOLOGICAL NOTES*

An Outbreak of Poliomyelitis

A small outbreak of poliomyelitis in Essex was reported to the Ministry of Health early last week and is under investigation by one of the medical officers of the Ministry in conjunction with the local medical officers of health Up to July 27 18 cases have come to notice 11 in Halstead Rural District 3 in Braintree and 4 in Dunmow Rural District There has been one death Four of the cases have occurred in a boarding school for boys The ages of the persons affected range from 3 years to adolescence One case has occurred in an adult of 26 years of age The local health authorities are taking all necessary precautions and the county medical officer of health for Essex is co-operating with the medical officers of health concerned Dr Norman Smith a medical officer of the Ministry of Health is assisting the local health authorities and is visiting the affected districts Small outbreaks of this disease are not uncommon in this country and an average number of 10 or 12 cases a week are notified A memorandum of the Ministry of Health on acute poliomyelitis which includes advice on precautionary measures against infection can be obtained from H M Stationery Office price 2d

Diphtheria and Scarlet Fever

Notifications of diphtheria in England and Wales during the week under review rose from 1 001 to 1 075 and in London from 127 to 15 There was a decided decrease in the notifications for Scotland—121 as against 151 recorded in the previous week—but in Eire and Northern Ireland there were small increases—58 compared with 49 and 24 compared with 21 respectively Deaths from diphtheria in the 126 Great Towns of England and Wales rose from 22 to 26 and in London from 2 to 3 Of the 26 deaths recorded in the 126 Great Towns 5 (1) occurred in Liverpool 3 (1) in South Shields and 2 each in Chester (0) and Sheffield (1) There were 2 deaths from diphtheria in the 16 principal towns of Scotland during the week under review—1 each in Glasgow and Edinburgh There was a slight decrease in the number of notifications of scarlet fever in England and Wales during the week—1 750 compared with 1 781—but in London an increase was noted—168 (157) In England and Wales the figures were in excess of the median value for the last nine years but in London they were considerably less There were 3 deaths from scarlet fever in the 126 Great Towns of England and Wales during the week under review compared with 2 in the previous week Notifications of scarlet fever in Scotland rose from 295 to 310 with 1 death (in Greenock) In Eire they remained at 7 while in Northern Ireland they fell from 71 to 56 in the week under review

Primary and Influenzal Pneumonia

There was a rise in the notifications of primary and influenzal pneumonia in England and Wales during the week under review—500 to 528—but in London the figures dropped from 42 to 37 both these figures are below the median values for the last nine years

Measles and Whooping-cough

The incidence of measles in England and Wales continues to decline Deaths in the 126 Great Towns have fallen from 7 to 5 during the week under review one of them being in London The number of cases reported in the L C C elementary schools during the week was 176 compared with 250 in the previous week while the average daily admissions to the L C C fever hospitals fell from 12 to 9 for the week under review Notifications dropped in nine of the metropolitan boroughs in which measles is notifiable and rose in Fulham—10 as against 9 in the previous week—and Greenwich—22 as against 19 In Scotland the figures for measles rose during the week from 91 to 109 of these 54 (19) were in Kirkcaldy 22 (18) in Falkirk and 8 (23) in Dunfermline There have been more deaths from whooping-cough than from measles during the week—6 for England and Wales as against 5 for measles and 2 for London as against 1 for measles in Scotland there was 1 death each from both diseases in Glasgow and Dundee respectively

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

Cholera

A considerable increase in the incidence of cholera has been reported in China during the week For the week ended July 16 in Shanghai there were 418 cases with 152 deaths compared with 225 cases in the previous week in Hong Kong in the same week there were 60 cases with 53 deaths compared with 43 cases and 32 deaths in the previous week The Chinese Health Administration which has been working in close co-operation with the League of Nations has asked the League for 6 000 000 doses of cholera vaccine In response to the appeal Australia and Ceylon have each sent 500 000 doses the American Red Cross 1 000 000 doses Turkey and Rumania each 1 000 000 doses Yugoslavia and the Pasteur Institute at Hanoi each 500 000 doses Smaller amounts have also been received from the Serum Institute at Copenhagen the Egyptian Ministry of Health and the Institute of Bacteriology at Buenos Aires In British India cholera has been declining in recent weeks with the exception of Berar with 2 825 (1 959) cases and Madras 434 (414) cases

Small-pox

A review of the epidemic of small-pox at Hong Kong has revealed that nearly 2 000 persons lost their lives this year The total figures were 2 284 by the end of May and 1 920 patients died (case fatality 84 1 per cent) Over 75 per cent of the fatal cases occurred among children The epidemic reached its peak in the middle of March when an average of 40 cases daily were recorded but for the last few weeks only one or two cases have been reported

Medical News

The House of the British Medical Association including the Library will be closed from 5 p m to-day (Friday July 29) to 9 a m on Tuesday August 2 (Library 10 a m)

All who contemplate attending the third international congress for microbiology New York City September 2–9 1939 are asked to send their names to Dr R St John Brooks secretary of the British National Committee (Lister Institute Chelsea Garden London S W 1) Some knowledge of the numbers likely to make the journey will greatly facilitate arrangements for securing advantageous terms of transport from shipping companies

The first number has been published this week of the *British Journal of Rheumatism* edited by Dr M B Ray and described in the subtitle as an independent review mainly devoted to the practical and clinical aspects of rheumatism Lord Horder writes a short send-off Dr Fortescue Fox follows with a foreword and there is an editorial outlining the aims of the new quarterly publication (price 12s 6d per annum single copies 3s 6d)

The issue of *Paris Medical* for July 16 which is devoted to psychiatry contains the proceedings of the seventeenth international neurological reunion held in Paris on May 31 and June 1

During the State visit of the King and Queen to Paris last week Her Majesty accompanied by the Duchess of Northumberland inspected the Hertford British Hospital This institution with forty beds is in the Rue de Villiers Founded in 1877 by Sir Richard Wallace it was made over to the British Government by deed of gift in 1892 Its object is to give medical care and relief to needy men and women from any part of the British Empire but the original endowment only suffices now for one third of the annual expenditure The chairman of the hospital Sir Alfred S B Tebbitt presented members of the Committee of Management and the French visiting physicians and surgeons headed by Dr Charles Flandin to the Queen before she made a tour of the wards

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B M A House Tavistock Square W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary B M A House Tavistock Square W C 1 on receipt of proofs Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary B M A House Tavistock Square W C 1

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111

The TELEGRAPHIC ADDRESSES are

EDITOR OF THE *BRITISH MEDICAL JOURNAL* *Aitiology Westcent London*

SECRETARY *Medisecra Westcent London*

The address of the B M A Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I M A and B M A) 18 Kildare Street, Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin)

QUERIES AND ANSWERS

Mammary Cancer and the Menopause

Dr R ANDERSON (Birmingham) writes For a long time I have been under the impression that women who suffer much from the flushings of the menopause are not so prone to breast cancer as those who don't Yesterday I saw a woman who is suffering from a secondary growth after excision of the breast three years ago She told me that she had had very few flushings and that her mother who died of breast cancer also had very few Judging by the treatment now advised for post menopausal symptoms I suppose it is taken as proved that these are due to a diminution or lack of oestrone in the system It would be interesting to know whether those women who do not suffer to any extent from flushings have an excess of oestrone Dr W E Gye (*Journal* March 12 p 551) states that oestrone injected into mice causes tumour formation not at the site of injection but in the mammæ Oestrone is evidently one of the factors concerned in the production of breast cancer and I think therefore that a great deal of caution should be used in giving it I would like to know whether any other reader has formed the same impression about the incidence of breast cancer

Hormone Therapy of Prostatic Hypertrophy

V EACH (Cornwall) would like advice from any reader who has had personal experience of the treatment of prostatic hypertrophy with injections of testicular hormones What dosage should be administered and at what intervals?

LETTERS, NOTES, ETC

"Q" Fever in Queensland

The annual report for 1936–7 of the Health and Medical Services of the State of Queensland shows vital statistics which compare favourably with those of the other States of the Commonwealth The crude birth rate was 19 7 and the death rate 8 78 the infant mortality rate was 36 20 per thousand The respective figures for the Commonwealth of Australia as a whole were 17 13 9 43 and 41 16 The report states that work on the unclassified fevers of the coastal districts of South Queensland proceeded steadily throughout the year with special concentration upon the problems involved in two fever types Q fever and seven day fever The latter is due to a leptospira of mild virulence All the cases of Q fever occurred in men Thirteen were employed in an abattoir some were farmers or farm workers, one was a braceman employed on new sewerage construction and one was a laboratory technician engaged in the actual study of the fever itself The report describes at some length the clinical features of the disease and the results of laboratory investigation The problem of leptospirosis was studied by the mobile unit attached to the Laboratory of Pathology and Microbiology and it appears to be established that a mild leptospirosis is a not uncommon cause of illness in South Queensland previously diagnosed as coastal fever influenza or dengue An appendix to the report is devoted to the hookworm campaign

Parturition with Albuminuria and Raised Blood Pressure

Dr C DYSANT (Bromley Kent) writes The following case may perhaps be of interest A multigravida aged 40 five previous confinements began labour at 12 noon and was delivered at 1 30 p m one and a half hours later of a 15 lb male baby She had been confined to bed for three weeks with albuminuria and blood pressure up to 174 mm Hg systolic 110 diastolic The albuminuria cleared up but the blood pressure varied and was 160 mm Hg systolic 90 diastolic before confinement There was no shock and both mother and child are doing well

Epsom College

Major W L GIFFARD O B E Secretary of the Royal Medical Foundation of Epsom College, writes At the annual general meeting of the Governors of Epsom College held last month after reference had been made to the kindness of the Editor of the *British Medical Journal* in publishing articles and notices about the Royal Medical Foundation and its aims a resolution as under was unanimously passed by the meeting That the Annual General Meeting desires to place on record its appreciation of the kindness of the Editor of the *British Medical Journal* for his readiness at all times to publish notices regarding Epsom College and its Royal Medical Foundation'

Artificial Respiration Apparatus

Dr D EDGE (Medical Superintendent Ladywell Sanatorium and Isolation Hospital) writes In view of the demand for the artificial respiration apparatus miscalled iron lung may I be permitted to point out that there is one available at Ladywell Sanatorium and Isolation Hospital Eccles New Road Salford 5 Lancs

*** An authoritative letter on the Bragg Paul pulsator by Sir William Bragg appears this week at page 254

Sterilization of Syringes

Dr A E FINCKH (Sydney N S W) writes I have been in practice as a clinical pathologist for over thirty years during which time I have made thousands of venupuncture Needles and syringes have always been subjected to boiling being placed in cold water and brought to the boil Not once have I experienced a mishap

Medical Golf

Dr A Keith Forbes and Dr A J Buchan each won two of the five events held by the Scottish Medical Golfing Society at its meeting on Princes course (Sandwich) last week end Keith Forbes (16) won the bogey competition with a return of one up and the Silver Haggis (Eclectic) 64 net while Buchan (7) took the stroke competition with 76 net and the Captain's Prize with 72 net The four ball event against bogey went to Drs G Gilchrist (6) and Norman Fleming (14) with a return of 9 up

Corrigenda

A printing error which it is important to correct occurred in Dr F G Hodson's article on Measles in the *Journal* of July 23 (p 174) Owing to a misplaced line the inscription under Table V was without meaning It should read 100 per cent infected 0 per cent escaped no complications 22 protected cases all had attenuated attacks

Our recent notice of *The Diet for Expectant and Nursing Mothers* published by the Food Education Society erroneously named Miss J Halford as the author The little book is the work of the Society and Miss Halford contributed a foreword

KEY TO CURRENT MEDICAL LITERATURE

Method of Administration of Anti pneumococcal Serum—O Cannon and H Ewart
Treatment of Acne—D E H Cleveland
Applied Physiology of Thyroid Gland—J E Pinkett

Venereal Disease in Pregnancy—The incidence of syphilis and gonorrhoea in pregnancy would appear to be decreasing as the result of education of the public venereal disease control methods and adequate facilities for and improved methods of treatment Examination for these diseases including Wassermann and Kahn tests should form an integral part of every pre natal routine Anti syphilitic treatment is safe provided the dosage of arsenicals is moderate and the patient is kept under close observation for evidence of toxic manifestations Routine plans for the treatment of pre natal syphilis and gonorrhoea are fully described in this article by Goodwin

Insulin in Urticaria—Two cases of urticaria are reported which showed remarkable improvement after the administration of small doses of protamine zinc insulin One of these was associated with sensitivity to wheat eggs and milk and the other was of unknown origin

Blood Donors—In order to obtain convalescent serum for the treatment of poliomyelitis during an epidemic in 1936 Cadham had occasion to withdraw frequent small amounts of blood varying from 65 to 140 c.cm from 125 donors None of the donors reported any ill effects On the contrary many of them stated that they were definitely improved in general health Points noted were an improvement in appetite disappearance of acne cessation of attacks of urticaria and increase of weight Cadham suggests that under certain circumstances the withdrawal of limited amounts of blood at regular intervals may prove of decided therapeutic value

Need of Redetermining Schick negativeness in School Children—A B Schwartz and F R Janney
Chemistry of Vitamin A and Substances having a Vitamin A Effect—L S Palmer

Premenstrual Tension—The syndrome of premenstrual tension includes as symptoms irritability restlessness crying spells headaches vertigo insomnia painful turgidity of the breasts and nymphomania It arises during the height of corpus luteum activity and is aggravated by oestrogen therapy Israel studying fourteen cases found that substitutional therapy with progestin and low dose irradiation of the pituitary and ovaries relieved the symptoms

Gentian Violet—Sutton strongly recommends the use of gentian violet in dermatological conditions due to such Gram positive organisms as *Staphylococcus aureus* the gonococcus and *C diphtheriae* and in those due to monilia and to a less extent to trichophyton epidermophyton torula and saccharomyces The main disadvantage is the conspicuous colour which can however be removed from linens etc by repeated washings with water and alcohol or bleaching with chlorine Applications of a 1 to 2 per cent aqueous solution are best Gentian violet is non toxic and hypersensitive skin reactions to it are unknown

Some Newer Aspects of the Alcohol Problem—F Leary
Nephritic Toxaemias of Late Pregnancy—L Phaneuf and M Belanger

Nephritic Toxaemias—Careful ante-natal supervision has greatly improved the results in nephritic toxaemia of pregnancy. In seventeen years at the Carney Hospital there were 6,909 deliveries with eighty-eight cases of late nephritic toxaemia, an incidence of 1·3 per cent. Six women in the series had convulsions or eclampsia, an incidence of 0·1 per cent.

Nordisk Medicinsk Tidskrift

Stockholm vol 15 May 21 1938

Chemotherapeutic Essays in Gonorrhoea—C A Falk
Poisoning with Trichlorethylene with Special Reference to Chemical Cleaning Works—F H Schmitz

Chemotherapy of Gonorrhoea—The administration of a Swedish preparation of sulphanilamide at the St Goran Hospital in Stockholm in cases of gonorrhoea has been very successful. The best results were obtained in old and complicated cases. Though no serious sequelae were observed after the administration of sixteen tablets each of 0·3 gramme by the mouth daily for four days and a smaller total daily dose for the next eight to ten days, Falk considers that this treatment should as a rule be given only in hospital and that the public should not be free to purchase this drug.

Development of Sarcoma in Paget's Disease—O Schurch and F Uehlinger
Diagnosis and Treatment of Renal Carbuncle—F Suter
Treatment of Injuries of Veins and Arteries in Cubital Region—R Veraguth and R Montant

Ovariectomy in Non-puerperal Osteomalacia—The writer holds that the clinical picture of osteomalacia can be simulated by simple senile osteoporosis, fibrous osteitis of endocrine origin, exogenous causation and Paget's disease. Differentiation is only possible by biopsy of a bone. A portion of the iliac crest was taken in the case here described. The patient aged 38 had had no pregnancy for fourteen years. The bone findings are illustrated in detail before and after successful treatment by ovariectomy.

Surgical Tuberculosis.—In a consideration of the results of sunlight and climatic treatment of surgical tuberculosis in the Upper Engadine Kuprianer reports conspicuous success in disease of the spine sacro-iliac joint shoulder and wrist surgical measures are considered often preferable in advanced tuberculosis of the elbow and in tuberculous disease of the knee or foot the frequent occurrence of arthritis deformans after the conservative treatment of the foot is pointed out Ruppanner has found tuberculous disease of one or both kidneys in one third of his cases of tuberculosis of the lumbar spine The parts played by heliotherapy and by tonsillectomy in tuberculosis of the cervical lymph glands are discussed Good results are usual in peritoneal tuberculosis In tuberculosis of the epididymis local heliotherapy is to cease and excision is recommended

Acute Arterial Occlusion—The characteristics of the pains which accompany embolism of the large peripheral arteries are described. The results of certain forms of treatment are given and the authors suggest that a combination of various non-operative methods is best.

Haemorrhage into Coronary Artery Wall—Cases are described demonstrating the complete occlusion of the coronary artery by haemorrhage into the atheromatous wall. Thrombosis within the vessel may or may not be present. When it is it is probably a secondary effect. An infarct was not present in all cases but death was attributed to the coronary lesion in every one.

Vaginal Cysts—R L Sanders

Intracranial Carotid Aneurysm—This is a description of a case of lateral aneurysm of the internal carotid cured by occlusion of its connecting stalk. It is the first of this kind to be recorded.

Aneurysms of Circle of Willis—The evolution of the surgical treatment of intracranial aneurysm is reviewed. The problems in diagnosis and treatment of aneurysms of the circle as opposed to aneurysm of the internal carotid, are discussed.

Tracheo-oesophageal Fistula—A new method of surgical treatment is described. The stomach is divided transversely, the distal portion being made the site of gastrostomy while the upper segment provides free oesophageal drainage to the exterior. Subsequently the fistula is attacked directly.

Plastic Vagina—The space between the rectum and bladder is dissected and an adequate cavity is kept open by a vaginal mould. Rapid epithelialization occurs from the surface of the rudimentary vagina. Successful cases are described.

Progress in Internal Medicine: Diseases of the Heart: Review of 1937—A Grant and P D White

External Secretion of Pancreas—Observations carried out on a man with a pancreatic fistula are recorded. Foods, secretin, acid, water, mecholyl and physostigmine increased the rate of secretion; bile salts, bicarbonate, magnesium sulphate, adrenaline, atropine and histamine diminished the secretion. Qualitative without necessarily quantitative variations in secretion were seen in response to various stimuli.

Calcific Aortic Stenosis—Fourteen cases of this condition are reviewed and it is concluded that it is now possible to make this diagnosis in the living. Signs of aortic insufficiency associated with electrocardiographic evidence of myocardial disease in the absence of syphilis and bacterial endocarditis suggest the diagnosis. X ray examination will confirm or refute this impression. Cardiac failure occurs late in the disease, but syncope and sudden death are not infrequent.

Low Forceps Delivery in Relation to Mental Deficiency—I Wagner

Influenzal Meningitis—According to Young and Moore this condition is more common than is usually thought, especially in children under the age of 5. Occasionally the diagnosis is not made because of the pleomorphic appearance of the organisms. Prognosis is not uniformly bad provided adequate treatment is carried out with anti-influenzal serum together with sulphanilamide. The authors report a case treated in this way with remarkable success, and suggest that this combined treatment should be generally adopted.

Polyostotic Fibrous Dysplasia—L Lichtenstein

Fracture of Os Calcis—The methods reported in the literature for the treatment of os calcis fractures are ingeniously summarized by a pictorial review. Eight cases treated by immediate reduction by moulding with a clamp and blocks and subsequent plaster fixation are described.

Mechanics of Intestinal Obstruction—This is an experimental study of the effects of increased intra-enteric pressure in simple obstruction of the lower ileum. The resulting changes in the length and weight of the bowel wall are noted. The influence of enemata on intestinal tone, secretion and absorption and the transperitoneal passage of dyes are recorded. Increased secretion and diminished absorption are shown to produce a progressive distension leading to venous stasis, haemorrhage, infarction, necrosis and perforation of the gut. Impaired viability is followed by the passage of toxic material into the peritoneum. Death results from transperitoneal absorption of toxic substances or from peritonitis.

Polyostotic Fibrous Dysplasia—The author describes a group of cases characterized by multiple fibrous foci in the shafts of long bones, frequently unilateral and sometimes associated with similar changes in the skull and with a tendency to pathological fracture. Serum calcium readings are usually above the normal level. No evidence of parathyroid tumour has been found.

Low Voltage Deep Ray Therapy—J F Bromley
After-care of Patients suffering from Breast Cancer—F Hernaman-Johnson
Case of Marble Bones—J S Veitch
Dosage System for Interstitial Radium Therapy: Part II Physical Aspect—H M Parker

Ventriculography—The authors experience is based upon 806 ventriculographies in cases of verified cerebral lesions of which 643 were supratentorial and 163 subtentorial. By using a special technique and taking both sagittal and lateral views it was possible to localize the lesion in nearly all the cases examined. The size of the tumour generally corresponded to the amount of ventricular displacement except in cases with marked cerebral oedema.

Low Voltage Near distance X Ray Therapy—The strict localization of the x ray beam both in width and in depth is an advantage in numerous situations. Full dosage accurately measured is essential. At least 6 000 *r* must be given to carcinomatous tumours. For rodent ulcer the doses may be smaller. Multiple small fields are in general more efficient than single large fields. Occasionally however—as for example in rodent ulcer of the canthus of the eye—a small single field is permissible.

Bibliography of American Haematological Literature of 1936—O P Jones
Bibliography of Dutch Haematological Literature of 1934 to 1936—G Wallbrich

Leucocytosis and Leukaemia—Mice were injected with sodium nucleinate sodium caseinate and bile salts While the first two compounds caused leucocytosis bile salts produced leukaemia like changes in the blood and tissues This can perhaps be explained by the chemical structure of the bile salts which is similar to that of carcinogenic substances

Sternal Puncture—In sternal punctures the normal content of nucleated red blood cells is between 45 000 and 150 000 per c mm in leucopenia the figure is usually under 45 000 and in leucocytosis over 150 000 The margin of error is from 0 4 per cent to 14 4 per cent the average being 6 54 per cent Less than 0 1 c cm should be taken and the first drop only should be counted as this gives the highest and the most reliable results

Lymph Glands containing Blood—Blood is formed in the tissue of some human lymph glands especially in pre vertebral glands and in those of the splenic hilus Diapedesis through the wall of the venous capillaries is the most frequent cause There are usually other signs of a haemorrhagic diathesis The existence of haemolymph glands like those in ruminating animals can be excluded in human beings

Lung Changes in Electric Arc Welders—Iron oxide is deposited in the lungs to a marked extent only when the work is very confined The resulting nodulation gives ray appearances similar to those of silicosis Functional impairment of the lungs appears to be lacking however as to both the development of clinical symptoms and of susceptibility to infection

Isolation of Dust in Lungs—The merits and demerits of different methods of quantitative determination of mineral deposits of various kinds in lung tissue are discussed The authors favour the use of perhydrol (Merck) with 30 per cent hydrogen peroxide added to decompose the lung tissue The small amount of acid formed during the process does not affect the result unless carbonates are present in the lung tissue to a marked degree Iron ore dust was removed unchanged and confusion with the iron content of blood avoided Where this method was not applicable (asbestos carbonates) fine grating of the tissue and centrifuging from a heavy fluid (acetylene tetrabromide diluted with benzene) was employed

Skin of the Newborn—One of the chief problems of maternity hospitals is the prevention of skin infections in newborn infants. Different methods of prevention are described. The author however suggests that the baby should not be cleaned in any way so that the vernix caseosa is not removed. The infant's skin is neither oiled nor bathed and only warm water is used to clean the buttocks. It is believed that the great advantage is that there is less handling of the skin and so less chance of infection.

Sulphanilamide—This drug was tried in a large series of children suffering from vulvo-vaginitis with no good result contrary to what has been reported by many writers.

Congenital Hypertrophy of Left Lower Limb. Remote Result of Irradiation of Epiphyseal Cartilage during Active Period of Growth—P. Dosquet.
Collective Radiophotography—V. de Abreu.
International Radiological Congress in Chicago, September 1937—J. Belot.

Collective Radiophotography—The radiographic examination of the thorax becomes expensive when many such examinations are undertaken in the course of a campaign against tuberculosis. The author has therefore adopted the principle of indirect photography of the radioscopic image. The image of the chest is projected on to the radioscopic screen which is then photographed by means of a miniature camera. The principle is not unlike that used in x-ray cinematography except that only one view of the chest is obtained.

Some Factors influencing Distribution of Radiation in Two-oblique Field Technique—M. C. Reinhard and F. Myers.
X-Ray Diagnosis of Thymus Gland in Children—H. A. Judson.

Dupuytren's Contracture—After briefly describing the aetiology and pathology of this condition the author relates his experience with x-ray treatment in ten cases. The following technique was used: 100 kV., 5 mA., 30 cm. f.s.d., filtration through 1 to 2 mm. of aluminium, single doses of 100 to 200 r (in air) given at weekly intervals for three to four weeks. Several such series may be given at intervals of six to eight weeks according to progress. Seven out of the ten cases improved under this treatment.

Enlarged Thymus—The author points out the difficulty and unreliability of the radiographic diagnosis of enlarged thymus in children. He questions the value of the radiotherapeutic test and in view of dangers from over exposure to x rays he advises moderate doses in the treatment of the condition. He also doubts the value of pre-operative radiographic examination for enlargement of the thymus in children.

Haemangioma—This is a comprehensive study of the capillary and cavernous forms of angioma with the many variations of each of these types. There are many methods of treatment such as excision, the injection of hot water or alcohol, vaccination for small lesions, irradiation and the injection of sodium morrhuate. These methods are discussed and the cases for which they are found most suitable are described.

Tubercle

London vol 19 May 1938

Critical Review: Modern Outlook on Tuberculin—H. J. Parish
*Aetiology of Bronchiectasis—W. E. Adams and L. Escudero
Desensitization in Treatment of Tuberculous Guinea-pigs—J. D. Thiver

Bronchiectasis—Experiments were carried out in dogs. Two factors were found necessary for the production of bronchiectasis—incomplete bronchial obstruction and contamination of the bronchial tree. Its development did not depend upon any particular organism: it was produced by both aerobic and anaerobic pyogenic organisms, by the tubercle bacillus and by distemper organisms. In no case did bronchiectasis develop if the obstruction of the bronchus was complete. Increased intrapleural negative pressure was important as a causative factor only in so far as the severity of the pathological changes was concerned: bronchiectasis developed to a somewhat more marked extent when an increased negative pressure was present.

Berlin vol 120 June 1938

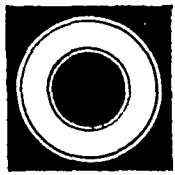
*Bactericidal Property of Raw Honey—Milan Jrica
Photographic Demonstration of Droplet Infection—F. Weyrauch and J. J. Rzymkowski
*Causes of Retraining Effect of Saliva on Growth of Capsulated Bacteria—A. Berk
Nomenclature of so-called Salmonella Group—Horst Habs
Observations on Scarlet Fever Epidemic in Pinneberg (1937): Certain Animal Experiments in Relation thereto—Otto Boyksen
Hygiene of Rural Workers' Dwellings—J. Mrugowsky
Further Vaccination Results with Small-pox Protective Lymph from Cultures on Allantois Membrane of Chicken Embryos—Walther Lehmann
Recent Tests of Efficacy of Diphtheria Anatoxin Precipitate: Single Injection—I. Farago
Epidemic Hepatitis in Dossenheim near Heidelberg—Herbert Deines
Investigation of W forms obtained by Passage of V type Typhus Bacilli through Chamberland Filters—Giulio Buonomini
Minimal Infection with Tubercle Bacilli—B. Lust

Raw Honey—Following the researches of Dold Du and Dzeto, who found an inhibitory factor (inhibine) in raw honey, the author shows that this property is not due to the normal acid content of natural honey and still less to its sugar concentration but to a secretion product of the bee. The substance is filterable, thermolabile, sensitive to increased acidity and almost insensitive to diffused daylight. It is strongly bactericidal to both Gram-positive and Gram-negative bacteria.

Saliva—The author follows up previous research by Dold and others (cited) upon an 'inhibine' in saliva. Dold's results in certain respects are confirmed. Activity is more marked when excess of bacteria is present: heating renders the saliva inactive and its properties are not regained by adding fresh saliva.

Zeitschrift fur Krebsforschung

Berlin vol 47 May 21 1938



Shope Papilloma and Shope Carcinoma: Spontaneous and Experimental Transformation of Papilloma into Cancer—J. Horn
Experimental Investigations on Modification of Transplanted Tumours—Fr. R. Koch
Metaplastic Bone Formation associated with Epithelial Proliferation produced in Uterus of Rabbits by Follikulin—H. Pierson
*Production of Tumours in Rabbits by 1 2-benzpyrene—J. Klinke
*Production of Intramuscular Malignant Growths in Mice and Rat by 1 2-benzpyrene—J. Klinke
Further Investigations on Problem of Tumour Resistance—H. Auler and W. Schilling

Sarcomata from 1 2-benzpyrene—Klinke previously recorded the production of sarcomata in rabbits by injections of 1 2-benzpyrene. Three additional sarcomata have now developed after long latent periods. In the second paper Klinke describes similar experiments with rats and mice. Sarcomata resulted in a larger proportion of animals in shorter time and with smaller doses of benzpyrene than in rabbits. The tumours resulting from intramuscular injections did not originate from muscle cells. It is concluded that tumour production by highly carcinogenic substances requires a suitable animal species and a responsive tissue.

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

Patron: The Most Hon. the MARQUESS OF EXETER, C.M.G., M.D., D.C.

Medical Superintendent: DENIS TIMSIT, M.D., M.R.C.P., D.P.H., D.P.M.

The Recreation Hospital is situated in 100 acres of park and pleasure grounds. Voluntary patients are offering from incipient mental disorder or with insufficient recurrent attacks of mental illness; temporary patients and certified patients of both sexes are received for treatment. Careful clinical, laboratory, physical and pathological examinations are made with special reference to the history of the onset of the numerous mental disorders which are met with.

WANTAGE HOUSE

This is a Recreation Hospital in our 3rd bed grounds with a separate entrance which patients may be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It has special departments for hydrotherapy, physiotherapy, including Turkish and Russian baths, the latest improvements in bath. Also Douche, Electrical bath, Plombieres treatment etc. There is an Operation Theatre, Dental Surgery, an X-ray room, an Ultra Violet Apparatus and a Department for Diathermy and High Frequency treatment. It has its own Laboratories for bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are other branch establishments and it is situated on a park and farm of 600 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm and garden and orchard of Moulton Park. Occupation therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The Recreation House of St. Andrew's Hospital is beautifully situated in a park of 100 acres. Golf, tennis, cricket, Fives courts, North West side of the Estate a mile from the farm forms the boundary. Patients may visit the Branch Hospital for a short period or for longer periods. The Hospital has its own private bathing house on the estate. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts, fives and hard courts, croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 1 Boat and Northampton) who can be seen in London by appointment.

COURT HALL, KENTON, near EXETER,

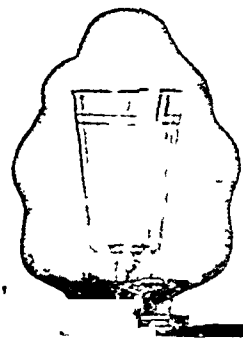
Choose a Spa in

Czechoslovakia

The Spas and Health Resorts of Czechoslovakia with their centuries old tradition of healing reinforced by the experience and researches of local specialists invite your serious consideration



In addition to places of world wide repute such as

PISTANY (Piestany) **CARLSBAD** (Karlovy Vary) **MARIENBAD** (Marianske Lazne) **FRANZENSBAD** (Frantiskovy Lázne)

ST JOACHIMSTHAL (Jáchymov) **TEPLICE-SANOV** (Teplitz Schonau) **LUHACOVICE** **SLIAC** **TRENCIANSKE-TEPLICE**

with their medicinal springs and mud baths there are numerous smaller spas and health resorts admirably equipped for the treatment of many diseases including those in the following groups

Anaemia and Chlorosis Basedow's Disease Bronchial Catarrh Constitutional Diseases Scrofula Rickets Digestive Diseases Diseases of the Bladder and Urinary Organs Diseases of the Kidneys Diseases of the Nose and Throat Diseases of Women Disorders of Bones Muscles and Joints Disorders of the Heart. Disorders of Metabolism and Gout Gallstones Leucaemia Nervous Diseases and Post Hemiplegic Conditions Tuberculosis of the Lungs

The arrangements in the bath establishments are up to date in every way the cleanliness and neatness proverbial the service attentive and courteous

It is accepted that a spa cure to be fully beneficial should provide a complete change of surroundings and a break with the patient's normal everyday life

The Czechoslovak Spas fulfil this purpose admirably comfortable hotels first class orchestras and dance bands every facility for sport—tennis golf swimming riding fishing etc.

There are also numerous fully up to date homes for convalescence and rest cures

UNIVERSITY OF LONDON

BRITISH POSTGRADUATE MEDICAL SCHOOL (DEPARTMENT OF PATHOLOGY)

DIPLOMA IN CLINICAL PATHOLOGY

A COURSE OF STUDY in the academic year 1938-9 will be held for this Diploma commencing on October 3rd 1938. The Course will occupy twelve calendar months. The subjects embraced will be —

HAEMATOLOGY AND CLINICAL PATHOLOGY
PATHOLOGICAL CHEMISTRY
BACTERIOLOGY
MORBID ANATOMY AND HISTOLOGY

The Course will commence with Haematology and Clinical Pathology which will occupy about six weeks and will be followed by the Course in Pathological Chemistry which will occupy about the same time. The Courses in Bacteriology and Morbid Anatomy and Histology will run concurrently and occupy about six months. For the last three months of the Course students will be occupied in the practice of routine work in the laboratories of the Department and in revision work. The number of places in the Course is limited and students will be selected shortly before the Course is due to commence.

Fee forty guineas.

In addition to the full Course it will probably be possible to enrol a limited number of students for the subjects of Pathological Chemistry and Clinical Pathology and Haematology, separately. The Course in each subject lasting about six weeks. Fee for either Course nine guineas.

Further particulars may be obtained from the Dean, British Postgraduate Medical School, Ducane Road, Shepherd's Bush, London, W.12.

WINIFRED SHAPLAND,
Secretary and Registrar.

LONDON HOSPITAL MEDICAL COLLEGE AND DENTAL SCHOOL

THE WINTER SESSION will open on MONDAY, OCTOBER 3rd.

The London Hospital serves the East End of London and with eight hundred and ninety beds is the largest voluntary Hospital in England. The Out-patient Department which deals with a hundred thousand new patients per annum is extensively used for teaching.

The size of the Hospital necessitates a large number of resident medical officers. Every seventy resident house physicians and house surgeons and eighty salaried non-resident clinical assistants are appointed from among recently qualified students. The opportunities which these appointments offer for obtaining clinical experience are invaluable.

The Medical College is attached to the Hospital and is staffed by Professors of Anatomy, Physiology, Bacteriology, Chemical Pathology, Morbid Anatomy, and Medicine of the University of London.

Special Courses in Anatomy and Physiology for the Primary F.R.C.S. and advanced courses in Surgery for the Final F.R.C.S. Examination and in Medicine for the M.D. and M.R.C.P. Examinations are held twice a year.

Entrance Scholarships and prizes of the total value of £650 are awarded annually. Research Funds to the value of £113,000 permit of assistance being given to students and graduates engaged in medical research.

The Medical College contains a modern Museum of Pathology and a Library provided with all the current medical periodicals in charge of a full-time Librarian. There is also an Athenaeum Club and Dining Hall, a Gymnasium, a Fives Court, and two Squash Courts in the Students' Hostel. The Athletic Ground of 13 acres at Hale End is within easy distance of the Hospital.

The Hospital is only 9 minutes from Charing Cross and Baker Street Stations. For those who wish to live in immediate proximity to the Hospital there is accommodation for sixty students in the Student's Hostel.

Further details may be obtained from the Dean, Dr. A. E. Clark-Kennedy, M.D., F.R.C.P., Physician to the Hospital and Fellow of Corpus Christi College, Cambridge, who is always pleased to meet students wishing to see the Hospital and College and to whom application for admission should be made.

Turner Street, London, E.1.

COACHING personally or by post for final surgical examinations. Fees moderate.—Address, No. ..., BMA House, Tavistock Square, W.C.1.

THE KIRKDUNCANSON FELLOWSHIP FOR MEDICAL RESEARCH

The Council of the Royal College of Physicians of Edinburgh will shortly award a Fellowship to the candidate who in the opinion of the Council is deserving of the Fellowship and who furnishes satisfactory evidence of his ability for research. The Fellow will be required to devote his whole time to the tenure of the Fellowship and shall not, without the consent of the Council, hold any other Fellowship, Scholarship or Exhibition or hold any paid appointment or undertake any remunerative work.

The value of the Fellowship for the first year will be £300. The Council may renew the tenure of the Fellowship for a second or subsequent year or years at an increased emolument.

Applications must be lodged with the Secretary, Royal College of Physicians, Edinburgh, not later than August 10th, 1938.

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy and applications are invited for entry in September, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years, which if desired is usually extended to five years at the discretion of the Admiralty

At the end of three years' service, officers may retire with a gratuity of £400, but those who serve for five years will receive £1 000

At the end of five years' Short Service, permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Full opportunities exist for transfer to the permanent list and periods of unemployed or half pay are very rare The assistance of private income is not necessary for the purpose of supplementing official pay and allowances

Opportunities are available for officers on the permanent list for post graduate study, to specialise to take higher examinations and to obtain further qualifications

Naval Medical Officers are included in the Scheme for Marriage Allowance under the same conditions as for other Naval Officers

Copies of the regulations for entry and conditions of service, including rates of pay, allowances and retired pay, may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than 31st August, 1938

Appointments for Medical Officers in the ROYAL AIR FORCE

Medical men are invited to apply for Short Service Commission in the Royal Air Force Candidates must be registered under the Medical Acts and be not more than 31 years of age on entry

The period of service is 3 years—extendible to 5 years A gratuity of £400 or £1 000 is payable at the termination of 3 or 5 years respectively Permanent commissions are awarded in a number of cases These offer a pensionable career with the opportunity of extra leave on full pay for specialised study Applicants who hold—or are likely to hold—post graduate appointments in civil hospitals may on joining the Royal Air Force be seconded until the termination of their appointments (for a period not exceeding one year) An interval of commission up to twelve months is allowed for appointments held at approved hospitals

INSURANCE
FOR
NATIONAL HEALTH
PRACTITIONERS

The Insurance Acts Committee of the British Medical Association, after protracted negotiation, secured for all Insurance Practitioners an opportunity of entering a

Pension and Insurance Scheme providing

(a) Pension at age 65
(b) Disablement Income
(c) Family Protection

at extraordinarily low rates which are available only until

September, 1942

Policies effected prior to that date will not be affected by any alteration made thereafter

The scheme was made available also to members of the Association not engaged in National Health Insurance practice

These policies are issued through the Medical Insurance Agency of B M A House, Tavistock Square, acting as agents of the Insurance Offices which adopted the scheme for the collection and receipt of quarterly premiums

All other insurances, Motor, Household, Educational, Life and Endowment etc, are also available at specially favourable rates

In this as in all else

THE M.I.A. EXISTS TO PROTECT YOUR INTERESTS AND SAVE YOUR MONEY.

Take THE BURBERRY *With You*

Then, if the bright morning does turn out to be a drenching afternoon, or the warm breeze change to a biting Nor'-east wind, you're certain of being dry and comfortable

Under its protective cover there is comforting warmth on cold days, complete security from penetrating rain, airylight freedom on the closest day

The Burberry, therefore, has the virtues of three coats in one —

DUST-COAT for hot dry
WEATHERPROOF for wet
OVERCOAT when it's cold

Patterns, prices and illustrated models on mention of the "British Medical Journal"

AMEN HOUSE. WARWICK SQUARE. LONDON. E.C.4

In the most unexpected places

The illustration below shows a retailer's cottage premises in the little village of Cockfield, Suffolk Player's Navy Cut Cigarettes can be purchased here, as in many similar picturesque and remote spots all over the country

Numerous letters from smokers tell of pleasure in finding their favourite "Player's" on sale here, there and everywhere in the most unexpected places The vast demand which makes this possible also ensures their unfailing freshness, and is proof supplied by smokers themselves that there is no better Cigarette at 10 for 6d

Remember also, whatever your taste, you can please yourself by choosing "Medium" or "Mild" blends—Cork-tipped or Plain

THE Tampax Stand AT THE BRITISH MEDICAL ASSOCIATION EXHIBITION

At the recent B.M.A. Exhibition great interest was aroused by the Tampax exhibit of the new method of sanitary protection. Doctors at once appreciated the significance of this adaptation of the vaginal tampon to menstrual hygiene. Dispensing with applicators Tampax minimises risk of infection and completely eliminates labial irritation. It confers freedom and peace of mind.

Tampax is made of long-fibred surgical cotton wool which has been scrupulously and highly compressed. Each tampon has an absorption capacity of 1—1½ ounces. It is individually sealed with its own applicator enabling it to be correctly inserted without contact with the hands. A cord sewn through the cotton by an exclusive stitching process ensures easy removal and makes disintegration impossible.

Tampax may confidently be recommended by physicians for use by married women during normal menstruation. Its use by unmarried women should not be advocated when the size of the hymenal aperture would cause difficulty in insertion and withdrawal.

We will be glad to send doctors a full-size package of Tampax, together with a leaflet giving more detailed information. Please write to Tampax Ltd. 10 Bolton Street London W.1

OXYGEN AND NITROUS OXIDE

an important announcement

MEDICAL BOC SECTION

to physicians, anaesthetists and hospital authorities . . . .

OWING to the increasing demand for its Medical Gas Products, especially Oxygen and Nitrous Oxide, THE BRITISH OXYGEN COMPANY LTD has established a Medical Section which will control the distribution of Gases and Apparatus and the installation of Pipe Line Equipment throughout the United Kingdom

PRICES According to the consumption of the user and the size of cylinders prices have been established which are uniform throughout the country These prices in nearly all cases represent a considerable saving to Hospitals They are the same whether the Company's or privately owned cylinders are used Further saving can be effected by the use of larger cylinders Gases will be sold by "the cylinder" and not by the cubic foot

CYLINDERS Sizes are being standardised—the smaller and odd capacity cylinders are being withdrawn and large numbers of new 20 40 100 and 150 cu ft cylinders are being put into circulation All are being treated in enamel finish and fitted with new easy working Chromium Plated Valves The larger sizes for Oxygen Tent and Pipe Line use are fitted with self supporting ring bases

NO HIRE CHARGES In future no Hire Charges will be made on Medical Gas Cylinders Many thousands of new cylinders are needed to make this important innovation possible and the co-operation of customers is requested in the matter of the speedy return of empties

DELIVERY SERVICE Our fleet of vans has been considerably augmented so that almost every town in the Kingdom is covered by a Regular Guaranteed Delivery All gases are Delivered Free moreover intermediate requirements by Rail or Carrier are also (subject to certain conditions) delivered free Hospitals which already deal direct with the Company will receive automatically the benefits of the new conditions as from 1st July 1938 Others are invited to write for particulars

Allow the Medical Section to supply all your gas requirements—

OXYGEN OXYGEN + CO_2 CO_2 NITROUS OXIDE

Testimony by members of the Medical Profession . . .

Read what a doctor says —

"I think 'Ty phoo' is wonderful for sufferers from Indigestion"

The above is one of many hundreds of testimonials received

Medical men and women, throughout the country, are recommending our pure "Ty phoo" tea as indicated by the daily despatch of hundreds of samples which doctors direct us to send to their patients

Delicious "Ty-phoo" TEA is so mild that it does not cause indigestion

Over 18 000 DOCTORS use "TY PHOO" in their own homes

Further, you save by using "Ty phoo," for being so rich in "leaf-edge" it "goes just half as far again" as coarse astringent tea

Write to **Sumner's Ty-phoo Tea Ltd., Birmingham, 5,** for a FREE sample

(This offer applies only to the British Isles We regret that we cannot send Ty phoo tea abroad)

BISMULAIT

(DUNCAN)

A uniform and palatable preparation of Bismuth, containing 5 grains of freshly precipitated Oxycarbonate of Bismuth in each fluid drachm It is readily diffusible and the Bismuth is presented in the minutest hydroamorphous condition Bismulait is of the utmost value as a sedative or antacid in gastro-intestinal troubles

Also the following Combinations

BISMULAIT c PEPSIN

Contains 2 grains of Pepsin in each fluid drachm An ideal preparation for the treatment of Dyspepsia

BISMULAIT c SALOL

Contains 5 grains of Salol in each fluid drachm For the treatment of Dyspepsia associated with fermentation

Packed in 4 oz, 8 oz and 16 oz bottles
Sample on application

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl salicylic acid retains its reputation as one of the safest and most effective Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has however caused many to hesitate to employ it as widely as it deserves Exhaustive trial in hospital and private practice proves that Alasil definitely solves the problem of administering acetyl salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions

A supply for clinical trial with full descriptive literature sent free on request

In Alasil the desirable *therapeutic effects* of acetyl salicylic acid are well exhibited by its calcium acetyl salicylate moiety while the presence of Alocol (*Colloidal Hydroxide of Aluminium*) a powerful gastric sedative and antacid obviates any tendency to gastric irritation The superior absorbability of Alasil over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation Alasil can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds

"ALOCOL"

Colloidal Hydroxide of Aluminium

Effective in Nervous Dyspepsia

WHATEVER be the fundamental cause of nervous dyspepsia it is acknowledged that alleviation of the gastric symptoms is an important part of effective treatment

Nervous dyspepsia connotes hypersecretion This causes flatulence sour stomach discomfort and perhaps pain Alocol provides the ideal gastric sedative since its action is prompt and lasting and entirely free from harmful effect

Alocol acts by adsorbing excess of free hydrochloric acid in the stomach forming a colloidal jelly which passes through into the intestines and is finally evacuated Alocol therefore actually removes from the system the causative radicle (Cl) instead of merely temporarily neutralizing it Alocol does not interfere with normal digestion nor does it determine any unpleasant secondary reactions It is issued in tablet and powder form

Complete clinical history of Alocol with convincing clinical reports and sufficient trial supplies to physicians on request

INDICATIONS FOR 'SANATOGEN' No 8

THE TREATMENT OF ANÆMIA

"A conditioned deficiency"

A distinguished physician, addressing the Exeter branch of the B M A, recently emphasised "the close relationship between anæmia and disturbances of gastro intestinal function, since abnormalities in food intake, digestion and absorption must result in a deficiency of hæmopoietic principles"

Nearly always, anæmia is secondary—a symptomatic manifestation of some primary disease The first procedure must obviously take the form of replacement therapy The administration either of iron or, in the case of pernicious anæmia, of a hæmopoietically active preparation of hog's stomach or liver is specific

But, generally, the digestive and absorptive faculties are deranged, and the nervous system is impaired Both these conditions call for treatment if the specific therapy is to be effective Here 'SANATOGEN' has been found of great value

'SANATOGEN', consisting of 95% Milk casein, with 5% Glycerophosphate of sodium, is rapidly absorbed and utilised It is non irritative, and, in addition to its high direct nutritive value, it stimulates gastric functioning, increases appetites, and promotes the digestion and absorption of other foods taken with it

I tried Sanatogen in a female patient with extreme nervous debility partly due to anæmia and excessive indulgence in tobacco after having previously used Nervine Sedatives The general tonic effect was satisfactory and sound sleep without the use of any other drugs was attained, a steady but slow return to normal health being rendered possible The preparation seems to fulfil all the desiderata of a good tonic food —M B, B Ch

I have to say that I have had most satisfactory results with the aid of Sanatogen in the treatment of anæmia and weakness in a case of a young girl of 15, suffering from epistaxis —M O H, L R C P & S I

The case of anæmia following the loss of a large amount of blood after an operation, recovered very well with the administration of Sanatogen only'—L R C P & S

'SANATOGEN'

(Trade Mark)

IMMUNITY *against* NEXT WINTER'S COLDS

The second stage in the production of Dissolved Vaccines G L Harvesting the organisms after incubation

The new principles of vaccine therapy established by Dissolved Vaccines G L bring to Cold prophylaxis the assurance of majority success For although the primary infecting agent in the common cold still remains a subject for research, enough has been discovered about the secondary invaders to produce an effective vaccine for prophylaxis and treatment

★ Inoculation with Cold Dissolved Vaccine G L releases, for immediate utilisation, the antigens of those organisms which are responsible for the acute secondary stage of the cold The retention of full antigenic power excites a rapid and potent response from the body's defence mechanism

★ Moreover, detoxication (which is simultaneously effected by the solvent—sodium lauryl sulphate) enables a maximum dose (½—1cc) to be given from the first without fear of undesirable reactions Immunity is developed rapidly, three injections at intervals of a week usually being sufficient for the whole of the winter The injections should be started in the early autumn Finally, with the Dissolved Vaccine G L, antibody production is sufficiently speedy to shorten an actual attack if injections are started when the first symptoms appear

COMPOSITION of Cold Dissolved Vaccine G L Each cc contains in solution and detoxicated the antigens of

THE PHYSIOLOGICAL APPROACH TO FITNESS*

BY

E P CATHCART, C B E, F R S

Regius Professor of Physiology University of Glasgow

The question which I have been asked to approach from the physiological point of view is one of fundamental importance—the basis of national fitness I suppose most of us will have our own ideas as to the exact connotation of the word fitness The exact meaning we attach to the phrase will largely be conditioned by the question Fitness for what? Obviously a man may be perfectly fit to carry on some occupation and yet be unfit physically or psychically for some other trade occupation or profession Are we to confine our interpretation to mere physical fitness? Or is the word fitness as it well may be used simply as a synonym for perfect health? Or as a variant to connote a state of well being or of good nutrition or eutrophy? What are we looking for? What are we trying to attain? Personally my own reaction to and interpretation of the phrase national fitness is the building up of healthy human beings well balanced physically and mentally and emotionally who will be capable of all necessary adjustments to their immediate environment be it of work or play

The approach to this state of fitness which at the moment seems to be most in the public eye is that of physical training of some kind The fact is there is no single line of attack Many factors besides physical activity are concerned The provision of a diet adequate in both quantity and quality is of course one of the essentials but again diet alone no matter how perfect will not achieve the desired end Other factors such as an adequate supply of fresh air opportunities for sufficient sleep and for recreation contentment of spirit all play important parts I shall confine my attention to the physical activity and dietary aspects of the problem

The Aim of the Present Campaign

The aim I believe of the present campaign for physical fitness is to develop and perfect the potentialities which exist in all for the integration of the several bodily systems As a result of this integration it is hoped to achieve a harmony of motion a grace of carriage a pride of body a mental concentration and quickness of reaction and a happiness and contentment which characterize the really fit

And this training as it has to take place in the leisure time of all those over school age must be attractive it must truly give a sense of *re* creation It it were only concerned with physical *re* creation it might be regarded as a relatively simple problem but the need of rebuilding for the morrow may be as much psychical as physical In fact it might be said to day that with the ever increasing elimination of heavy manual work from industry and the ever increasing specialization of men to single operations the need for the *re* creation of the spirit is greater than that for the body Further I do not think it is emphasized sufficiently in these days when the sense of rights seems to transcend the sense of duty that physical training and indeed many forms of recreation properly carried out develop a true sense of discipline

When we realize that inevitably a very large proportion of those who will be trained or are being trained will enter on industrial work it is obvious that it is our duty to think in terms of alleviation It is probably true that the man or woman who had well developed muscles and who could use them was in greatest demand not so long ago To day when machine minding becomes ever more prominent we realize that although man may not yet have become and we hope never will the machine tickling aphid envisaged by Butler in *Erewhon* something more is required than mere brute force The qualities on which there is a premium to day are quickness alertness quick reaction time intelligence

No Short Cut to Perfection

There is no short cut to this desirable state of physical and mental perfection To attain it no amount of help no amount of direction no amount of guidance will suffice unless the willing co operation of the trainee is obtained People must want to be fit They must be prepared to pay the price The price that so many are unwilling to pay is steadfastness and discipline It is relatively easy to get Tom Dick and Harry and still more easy to attract Mary Jane and Ann to start but it is difficult to get them to continue in well doing So many want the final result without the necessary effort They want the balance of posture the perfection of rhythm without the labour which goes to the building up of smooth reflex movement The only exercises in the end which will be of value in retaining the performers are those which are creative which either allow the performer to express something innate by way of limb movements or give rise to the real belief that the systematic practice is creating a new body a new control The difficulty is to devise a suitable system Of one thing we may be certain—that no one system will suffice for all There must be exercises for the immature and the mature for the vigorous and the non vigorous alike So far as the children are concerned I am satisfied that the system carried out under the Board of Education is sound But

* Read in opening a discussion in the Section of Physical Medicine and Physical Education at the Annual Meeting of the British Medical Association Plymouth 1938

what have we to offer the adolescent and the adult of all ages? Recently the Board of Education has issued two suggestive handbooks Obviously the many exercises contained therein must be chosen with care by leaders, courses must be suitably adjusted from them This demands skilled and discerning leaders It is perhaps not within my province to discuss the nature of the exercises, but I should say that free standing exercises with a fair amount of apparatus work would be best for the male from post-school age to, say, 30 or 35, the amount of apparatus work being reduced for the majority as age advances In the case of young women, unless they so desire—and a certain number do exhibit a preference for apparatus work—the exercises should be all of the free-standing and floor-agility type For both sexes after the age of 30 to 35 the exercises should be confined to the free-standing type Generally speaking, I would endorse the classification of Lindhard as a guide to training, particularly of the 'keep-fit' type His classification is

1 Exercises the chief object of which is to discipline, to rouse, to educate in the general sense of the word

(i) Order exercises

(ii) Exercises of deportment

(iii) Walking exercises

2 Exercises the chief object of which is a systematic training of muscles and joints

Corrective exercises Head and neck, trunk, arm, and leg exercises

3 Exercises the chief object of which is the development of nervous co ordination Balance exercises

4 Exercises that aim in the first place at developing strength, endurance and resolution

Marching running, jumping, games, and sports

Lindhard's Scheme as a Basis

I feel convinced myself that if this scheme of Lindhard be adopted as a basis, the necessary choice of exercises being made from the books issued by the Board of Education and adapted to the age and the vigour of the pupil whether of 16 or 60, a course could be developed which in a relatively short time might simply transform the appearance of the average citizen I would lay special stress on the corrective exercises It falls to the lot of very few to carry out their several avocations in such a way as not to distort to some degree their physical frame Keeping fit does not merely mean the retention of health and vigour in any kind of framework The ideal is to get the frame, as well as the organs it contains and the muscles which bind it, as nearly balanced as possible The child at school, despite the provision of anatomically correct equipment, tends to adopt bad posture, the clerk at his desk, the worker at his machine, the labourer in the field, everywhere we turn—often, from the very necessity of the case, even the fact that the majority are right handed and not ambidextrous encourages wrong position—bad posture and unilateral development are the rule The bad posture tends to become permanent Surely one of the main purposes of the whole "keep fit' and physical training movement is to correct by suitable exercises such faulty developments and to restore to the frame whilst still pliable the resiliency and the beauty that are its right and proper heritage

Posture and Carriage

There is no question about the physiological gain to be obtained by the healthy organism from muscular activity, but I do not propose to deal with its effects in detail These may be found in, for example, Bainbridge's *Physiology of Muscular Exercise* Very few of our complicated muscular movements are inborn, they are the result of practice We assume too often that we have good control of our muscles until we try some new form of activity Most have passed through the humiliations of golf When we see a master of the game play it all looks so effortless and easy—till we try it We realize the same is true of any game, any art—for example, singing piano playing, or even of dealing cards at bridge—which demands exact co-ordination of muscle The obvious gain from constant exercise of muscles is a greater range of rhythmic movement, of better balance, of more accurate judgment, a greater resiliency of the body as a whole, a better carriage, better posture Our initial judgment of our fellow men is most often by their posture or carriage To quote from Lindhard's book on the *Theory of Gymnastics* "It seems as if on seeing a person with a good carriage we do not expect to find in him good physical qualities merely, but also good psychical ones bravery, courage, energy, firmness, well proven a noble mind It is as if it shows us the free man as opposed to the cowed bent slave' And on the whole I think it true to say that we do find some, if not all, of these extra attributes in individuals with good carriage

It should be emphasized, however, that there is no standard posture for all ages and both sexes The style of normal posture varies with the change in body build from babyhood to old age Still, there is a type of male posture at rest which should be aimed at where the whole figure, while not being stiff and rigid, should 'bear the stamp of controlled force' In the case of women the stance should be lighter but well poised and should suggest repose in oneself Far too many of the attitudes assumed as correct posture contain too much of the costly static effort In everyday life in common with all our other bodily activities our posture and movements are subject to emotional control We do recognize that "the ringing step of confidence, the halting pace of fear, the expansiveness of joy, the drooping air of grief serve to remind us of the pervasive quality of emotion

Physiological Effect of Muscle Activity

But muscular exercise does more than build up the nerve muscle control Probably the majority of the capillaries which exist in our tissues are only, so to speak, potential capillaries which open up to full activity when, for instance, the muscles are used Krogh has given a dramatic example of this state of affairs As he pointed out, in a piece of muscle no thicker than a pin there are some 700 capillaries and 200 muscle fibres When the muscle is at rest there is, however, comparatively little blood flowing through it, there are few patent capillaries, but as soon as it is active the latent or potential capillaries come into action to meet the enhanced needs The increased metabolism of active muscle demands an increased oxygen supply, and at the same time there is the need for more rapid removal of waste materials, including increased heat loss Moreover, with the increase in skeletal muscle activity there is, as a necessary result, increased cardiac activity, increased respiratory rate It comes to this that even a most limited form of exercise brings about a flushing and refreshing of the whole organism

It is perhaps not commonly appreciated that in almost all forms of muscular activity three separate phases of effort may be recognized positive, negative, and static

each differing in energy cost to the organism When we for example throw up an arm we perform positive work against gravity when we let it fall again back to our side this is negative work If we cease movement say in the upward swing and hold out the arm steadily from the body this is called static effort It is the degree to which the static component enters into all types of muscle effort which determines its severity in regard to the organism as a whole Hence it follows that any type of muscle work can be made more easy or more severe according to the amount of the static effort permitted to enter in It on the other hand however the static element be reduced too much rhythmic exercises for example may degenerate into mere dangling of the limbs Also the severity can be increased or diminished according to whether the displacement of the centre of gravity of the body as a whole is marked or not

Medical Supervision

There is no question in my mind about the propriety of medical supervision in some form But what are the standards to be since the type of physical exercises available are so very variable? Apart from gross lesions how are we to decide whether an individual should or should not participate in some form of exercise? There is the further difficulty that if a formal medical overhaul is made a *sine qua non* before permission to participate even in the relatively simple keep fit exercises this may act as a deterrent—so many people fear a medical overhaul If a medical examination were instituted the ultimate value might be even greater than that which accrued direct from the actual physical training There would be the further advantage that as the result of such a medical examination some indication might be given to the examinee regarding the type of more strenuous exercise for which he would be fitted It a single test of fitness has to be adopted it seems to me that some form of the heart tolerance test would be the best We are far too apt to assume that the average pulse rate and blood pressure are normal rates and pressures and that they play no part in or afford no guidance to the type of exercise for which an individual is suited According to the potentialities of a particular physique for particular exercises there seems so to speak to be the appropriate cardiovascular equipment In a study of Olympic athletes made by Bramwell and Ellis these differences (average values) are very clearly especially with regard to the pulse rate demonstrated in the case of runners

Type	Age	Weight (kilos)	Pulse	Blood Pressure		Pulse Pressure
				Systolic	Diastolic	
Sprints	22	64–65	66	116–119	75–81	38–40
Mid distance	23		63			
Long distance	24		61			
Marathon	27	60	53	103	3	45

As in other forms of long sustained strenuous effort so in marathon races the younger men seem to lack the necessary stamina for feats of endurance

The cardiovascular equipment of weight lifters was interesting Nine out of fifteen examined had resting pulse rates of over 80 per minute They had high systolic pressures five out of fifteen had diastolic pressures of over 100 (the average for the whole group was 90) and six had pulse pressures of 60 and over

The Question of Athletics for Girls and Young Women

Reference must I feel be made to the constantly debated question as to the extent to which girls and young women should be encouraged or permitted to take part in the more athletic types of exercise either in the gymnasium or in the sports field especially in forms of exercise which involve more or less heavy landing on their feet A great many opinions have been expressed but very little if any real evidence has been produced to show that such activities do give rise to uterine displacements So far as I am aware the best paper on the subject is that of McClov The conclusion reached by this writer is that the anatomical evidence would point to there being no real reason why girls or women *whose pelvic floors are uninjured and who have no pelvic infection* should not jump The shock of landing is for the pelvic organs negligible Obviously physical education departments should see that those taking part in such activities are adequately supervised

This question as to whether or no girls and young women should be permitted to jump is quite apart from the question as to whether they should participate in athletic exercise during the menstrual period Here of course opinions have been many and varied—from the recommendation that no abstention from sport should take place to the recommendation that no form of activity should be indulged in throughout the period Probably the *via media* of abstention during the first day of the flow is to be preferred It is a question which it is impossible to dogmatize about as the effect of the period varies so greatly in different individuals Too often it seems to be forgotten that menstruation is a normal physiological process Such evidence as exists would point to the view that the influence of normal menstruation is not greater than other influences of an accidental nature which might have affected the performance of the various tests at other times It is well to make it clear however that in some women the menstrual period may apparently bring about greater efficiency—a result probably of purely psychological origin

The Dietary Aspect

I shall now turn to a very brief consideration of the dietary aspect of this problem of fitness The spotlight is focused at the moment on diet not altogether to its advantage Too many seem to imagine that if only this or that be added to the diet all will be well that the root cause of malnutrition is poverty and lack of proper food No doubt these are potent factors but they are certainly not the only ones Emerson who has made a most intensive study of the problem of malnutrition in children cites in his book *Nutrition and Growth in Children* the causal factors in their order of importance They are (1) physical defects especially nasopharyngeal obstructions (2) lack of home controls (3) overfatigue (4) improper diet and faulty food habits (5) faulty health habits It will be noted that in Emerson's opinion diet occupies only the fourth place in order of importance

IS MEAT ESSENTIAL?

Of course it is perfectly true and perfectly obvious that anyone who is going to reap the full benefit of training must be adequately fed But adequate feeding does not mean elaborate feeding So far as our knowledge goes at the moment a diet consisting of brown bread milk butter cheese fresh fruit and salad could provide all the essentials As however we are in part at least concerned

with physical training the inevitable question arises as to whether meat is an essential constituent There is no scientific evidence to show that meat is essential The breakdown of the protein containing tissues particularly of muscle, during the performance of muscle work, provided there is an adequate supply of fat and carbohydrate or, in other words, of the energy-giving foodstuffs, is negligible Yet if one examines the great majority of training diets meat is a prominent constituent Practically all of the athletes at the Berlin Olympic games were large consumers of meat Evidently the appetite or tradition or a real pica demands the presence of meat Why this demand if there be no marked breakdown of muscle to repair? The explanation may in part lie in the fact that the extractives of meat are stimulating and have a definite and to many an attractive flavour The presence of the flavour may help in the consumption of larger amounts of the, on the whole, flavourless fats and carbohydrates which are required for energy production On the other hand, it must not be forgotten that strict vegetarians have shown themselves to be record-breakers in sport and to be capable of immense endurance I think the conclusion to be reached must be that the presence of meat is not essential

FATS AND CARBOHYDRATES

The protein problem has, it is true, aroused most discussion, but some very interesting facts are available regarding the consumption of fat As long ago as 1866 Frankland had noted that men engaged in really laborious work consumed for preference fat-rich diets "thick slices of bread surmounted with massive blocks of bacon in which mere streaks of lean were visible' Lavonius, who studied the food intake of professional Finnish wrestlers, found that calories derived from fat formed about 45 per cent of the total intake, whereas those from protein only accounted for about 17 per cent It has also been noted that in the diets of lumbermen and others engaged in hard work under severe environmental conditions the consumption of fat is high If other lines regarding the need for fat be followed it is becoming increasingly evident that fat, or at least certain fatty acids, play a more important part than mere sources of energy

There is no question about carbohydrate being the most readily available source of energy for the performance of muscle work But, contrary to general belief, the recent work of Krogh *et al* shows that there is no evidence during an hour's observation that glucose given during work, although it may cause a prompt rise in the blood-sugar level, well above resting level, is utilized Apparently the carbohydrate has first to be converted into glycogen Thus these authors maintain that in sporting events there ought to be about two days' rest before the contest, "to secure a complete filling up of the glycogen stores, and it appears that this cannot be done by taking large amounts of carbohydrate just prior to work"

I have cited some of the work relating to protein, fat, and carbohydrate simply as examples of the profundity of our ignorance of the whys and wherefores of somatic chemistry If we know relatively little about the fundamental problem of the three energy-giving materials which have been intensively studied for many decades, we know considerably less, both quantitatively and qualitatively, about the action of mineral salts and vitamins

Diet Not the Only Factor in Malnutrition

It may be thought that I am overstressing the negative side of the importance of food, that I am not giving it the importance which it so manifestly demands If that be so I desire most categorically to deny the interpretation that I under-estimate its value I have worked far too long at the problem But I do most emphatically desire to bring home the point of view that diet alone is not the only factor involved in malnutrition Far too many people take the path of least resistance Seizing on the very fact that diet is important, they shut their eyes to all other possible factors or, if they do not wholly ignore them, they belittle them or do not explore their potentialities There would possibly be no harm done if they stopped at the proclamation of their appreciation of an adequate dietary, but when they go on to promise all sorts of miracles which will happen if and when the average diet is altered in this way or that a very real danger arises The majority of these miracles cannot and will not happen The faith of the "man in the-street"—the man we all wish to help—in science and the scientific worker will be undermined

Conclusion

We require to keep a broad and open mind on the problem of how best to achieve fitness Just as there is no one cause of unfitness, so there is no one solution It is a problem of many facets with as many lines of attack It will not be achieved merely by the satisfaction of the somatic needs Malnutrition of the spirit is quite as common as malnutrition of the body The one reacts upon the other In these days when the raucous enunciation of rights threatens to extinguish the still small voice of duty, it should not be forgotten that fitness demands discipline Discipline is essential for right living Right living means health As Amiel said 'Health is the first of all liberties, and happiness gives us the energy which is the basis of health"

SKIAGRAPHY OF THE CHEST*

BY

GEORGE JESSEL, M A, D M., D P H

Consultant Tuberculosis Officer Lancashire County Council Visiting Medical Superintendent Peel Hall Pulmonary Hospital

The use of skiagrams as an aid to diagnosis may well be regarded as the greatest advance in medicine during the present century, worthy to rank with the discovery of antiseptics and anaesthetics Skiagraphy of the chest has become a most important and, indeed an indispensable adjunct in diagnosis Its routine application has often enabled a diagnosis of pulmonary disease to be made, even when the symptoms were referred to some other organ—for example, cases of so-called indigestion and gastritis or suspected appendicitis

In the training of medical students it has long been customary to emphasize the importance of a careful examination of patients, based upon history, symptoms, and the routine use of the standard methods of physical examination By such means the careful and experienced practitioner can accurately diagnose a fair proportion of the diseases of the chest from which his patients are suffering, while the consultant's wider experience of particular conditions will raise the standard of diagnosis still further Indeed, some experienced physicians have in the past, by clinical methods alone, achieved a remarkable degree of accuracy in diagnosis Their clinical instinct

* Read in opening a discussion in the Section of Tuberculosis at the Annual Meeting of the British Medical Association Plymouth 1938

which we now know to be closely related to a thorough and careful detailed examination of each patient coupled with an exceptional facility in recalling similar or related cases has sometimes been little short of uncanny Unfortunately the number of such gifted men at any one time is relatively few

Value of the Older Methods

It is well known that more mistakes in diagnosis are due to failure to make a thorough examination of the patient than to lack of knowledge The increasing popularity of skiagraphy, based on a growing appreciation of its value in the elucidation of difficult cases ought not to permit any relaxation in the thoroughness with which the older methods of examination are employed It is well known as Sampson and Lawrason Brown (1931) and others have shown that radiographs frequently reveal the existence of pulmonary disease in the apparent absence of any physical signs even when the patient is carefully examined by an experienced physician but there are likewise many cases where skiagraphic examination alone in the absence of information derived from a careful history and physical examination may provide information that is equivocal or misleading Accurate diagnosis depends upon a careful appraisement of all the available evidence including history and clinical laboratory and radiological examinations Skiagraphy should be regarded as an additional weapon in our diagnostic armoury but we cannot afford to ignore the information derived from interrogation eye hand and ear As Sir Arthur MacNalty (1937) has recently said pulmonary tuberculosis still reveals itself by physical signs and symptoms in other words inspection palpation percussion and auscultation are not displaced but reinforced by a skiagram of the chest

The Development of Skiagraphy

The National Health Insurance Act had as one of its objects the encouragement of insured persons to consult a doctor at an early stage of their illness and thus overcome the natural tendency of the sick to defer medical examination until symptoms became too obvious or painful to be further ignored The vast increase in the amount of work thus thrown upon the busy doctor has not infrequently rendered a thorough and detailed examination impossible Furthermore recent advances in medical knowledge have placed increasing responsibilities upon the overworked practitioner Often some method was needed that would furnish greater precision in diagnosis than could be provided by ordinary physical examination alone and at the same time introduce some objective means of checking conclusions previously reached The development of skiagraphy was thus timely In particular its use in doubtful chest conditions especially in the diagnosis of pulmonary tuberculosis has been of incalculable value It is unfortunately true that progress has been slow and uneven Indeed until well after the great war the use of skiagrams even by the enlightened was irregular and spasmodic in large centres patients were sometimes sent to radiologists attached to general hospitals but elsewhere little or nothing in this direction was practicable Those were the days when an x ray diagnosis of hilum tuberculosis or peribronchial fibrosis was fashionable Improvements in technique and increased experience have resulted in a reliable standard of diagnosis by competent radiologists and ample facilities for the production of first class skiagrams of the chest have existed in many areas for a number of years Unfortunately however outside the big centres and especially in the smaller urban and rural districts these facilities are still patchy and irregular It is the duty of the councils of counties and county boroughs to make provision for the specialist diagnosis of tuberculosis available for the whole population but some local authorities are still laggards in this respect It is thus not surprising that even in 1937 pleas were still being made for an increase in the use of skiagrams in the diagnosis of chest diseases in general and of tuberculosis in particular (Davies 1937) On the other hand although there is good reason to believe that a steadily increasing number of medical practitioners realize the value and importance of skiagraphy there are still far too many who fail to make enough use of the facilities now available

Its Use in Diagnosis of Pulmonary Tuberculosis

It is arguable that skiagraphy of the chest need only be employed on occasions more or less frequent depending upon the personal factor when the physician finds that ordinary clinical methods are insufficient to enable him to make a firm diagnosis There are it is true a number of well marked cases of pulmonary tuberculosis with tubercle bacilli in the sputum, where x ray examination is unnecessary On the other hand there are a large number of cases where owing to the failure to make use of skiagraphy early tuberculosis has been missed until the disease has become evident even to the laity

In 1933 I wrote as follows (Jessel 1933)

> Diagnosis has of recent years become much more precise as the result of the intelligent use of good x ray apparatus In cases of suspected fracture failure to use such facilities ranks as negligence and I think the time is not far distant when a similar view will be taken in cases where there are reasonable grounds for suspecting tuberculosis

This view has received striking confirmation by a recent decision of the Court of Appeal (Connolly v Rubra) *According to the reports of the case Lord Justice Greer* (1937) remarked

> Tuberculosis is one of many diseases with which a general practitioner commonly has to deal If the doctor has any doubt whether or no there are signs of tuberculosis it is his obvious duty to make further examination to resolve that doubt and to make it clear that nothing further could be done for the patient A doctor who is not over confident of his own judgment will when he finds himself in a difficulty call an expert and decide according to the expert's advice To enable the expert's opinion to be of value it is not enough to do what Dr Rubra did at a later date—namely to take one specimen of sputum and be content with that if the result is negative he must take many specimens of sputum and in addition he ought to have an x ray examination and to watch the patient to see whether he is progressing or going back as time goes on

The disadvantages resulting from delay in the use of skiagraphy are (1) the longer time that is usually needed to reach a diagnosis and (2) the tendency to play for safety and to diagnose a non existent tuberculosis I refer specifically to tuberculosis because being an infectious disease it is most important that it should be diagnosed as early as possible in order that remedial and preventive measures may be taken without delay Pulmonary tuberculosis should be regarded as at least a possibility and skiagraphy be employed in the following circumstances

1 In cases provisionally diagnosed as bronchitis or bronchial catarrh which do not clear up within four weeks

2 Where patients complain of indigestion and dyspepsia Many so called gastric or duodenal ulcers are really manifestations of tuberculous toxæmia

3 In cases of alleged haemoptysis
4 In young persons with symptoms of debility or anaemia
5 In cases of chronic hoarseness
6 In cases of ischio rectal abscess
7 In all cases where there is a clear history of tuberculosis in some member of the immediate family or household
8 Where there is a history of some other close association with a case of pulmonary tuberculosis—for example friend or workmate in office or factory
9 Where a case of tuberculous meningitis or other form of non pulmonary tuberculosis is found attention should be directed to adult members of the household, even if stated to be in good health in order to discover a possible source of infection

When a diagnosis of pulmonary tuberculosis has been made skiagraphy is often of great value

1 To determine the extent and nature of the disease—for example unilateral or bilateral, presence of cavities fibrosis calcification etc The information thereby obtained is often of great assistance in deciding the nature of treatment
2 During the course of treatment serial skiagraphy is essential in artificial pneumothorax and whenever surgical measures are contemplated—for example phrenic operations division of adhesions and thoracoplasty
3 Serial skiagraphy also gives great service in enabling the progress of the disease to be readily ascertained, as well as in providing opportunities for the study of living pathology

Skiagraphy in Differential Diagnosis

Apart from the question of tuberculosis, skiagraphy of the chest is important in the differentiation of pulmonary disease Assuming that tuberculosis can be definitely excluded, skiagraphy may clearly indicate or suggest chronic bronchitis, bronchiectasis (especially when used in conjunction with lipiodol), pleurisy, pneumonias abscess, malignant disease, silicosis Unsuspected morbus cordis may likewise be discovered Caution must, however, be exercised in the interpretation of skiagrams, as the appearances—for example, in cancer, tuberculosis or silicosis—may at times be indistinguishable An opacity may be due to fluid thickened pleura, consolidation atelectasis, abscess, or underlying new growth Consistently accurate diagnosis is only possible when skiagraphy is correlated with clinical evidence It demands judgment and experience Indeed, skiagraphy may easily lead to misunderstanding and confusion shadows of bronchi and blood vessels seen in their various aspects and angles may be misinterpreted as evidence of disease It is not impossible by skiagraphy, as by older methods of clinical examination to diagnose non existent tuberculosis which is almost as serious as failing to detect tuberculosis when it is present

Skiagraphy of the chest is a specialty within a specialty The taking of a good skiagram and its interpretation are by no means easy The well to do are in general, adequately catered for in this respect by radiologists, and there are also a few consultants and general practitioners who can produce excellent skiagrams The cost, however, is undoubtedly a deterrent, but fortunately skiagraphy is obtainable at or in connexion with many tuberculosis dispensaries and the chest clinics attached to some large hospitals This provision needs to be extended so as to make chest skiagraphy readily available for every citizen The presence of x ray apparatus at or in close association with a tuberculosis dispensary or chest clinic affords an ideal solution of the problem

Routine in a Lancashire Area

This is not the occasion to deal with technical details, which are mainly of interest to those practising radiology It is, however, desirable to illustrate what has been said above by a brief description of what obtains in the Lancashire area with which I am associated The population of the area is about 370,000, and is mainly urban in character It contains five tuberculosis dispensaries, as well as a small hospital of fifty seven beds for adult male pulmonary cases The medical staff consists of three tuberculosis officers working as a team one of whom (in this case myself) acts as radiologist at the central dispensary, where the x-ray apparatus is situated Early in 1923 I used a gas tube apparatus but since 1932 an all British single valve unit that has given complete satisfaction Exposures of one tenth of a second at four feet distance have been found to give good results Two afternoon sessions are held weekly Nearly all the patients, who are referred to the dispensaries or are seen at home in consultation with the insurance practitioner or private doctor, attend one of these sessions by appointment Bed cases, if not too ill are brought by ambulance, and by this means acute non-tuberculous conditions can be identified and studied On the same afternoons an artificial pneumothorax refill clinic is held elsewhere in the building by another tuberculosis officer, and these patients are screened at the beginning of the session Screenings for diagnosis are seldom done, as the information to be derived from them is regarded as of far less value than a skiagram which provides a permanent record to be examined and discussed at any subsequent time In difficult cases oblique and lateral, also postero anterior flat films are regularly taken Non-pulmonary as well as pulmonary cases are dealt with, and the total volume of work done may be gauged by the fact that 1,339 skiagrams were taken and 557 screenings done during 1937 It is necessary to emphasize the point that the skiagrams are all taken at a tuberculosis officer who has before him the clinical notes made by himself or by one of his two colleagues During each x-ray session two medical officers work in conjunction, one is a clinician radiologist, the other gives useful help in chest throat, and other examinations Cases definitely tuberculous are dealt with at once the patient interviewed and the necessary treatment arranged Other patients are referred to the dispensary nearest their homes for re-examination at a later date, but most cases are definitely diagnosable by this combined clinico radiological method within a fortnight On the morning following each x-ray session the three tuberculosis officers meet as a board to examine the films together with the clinical dossier of each case The position is analogous to that of a bench of magistrates weighing the whole of the available evidence derived from various forms of examination, including skiagraphy and reaching a conclusion based upon the different findings taken separately and in conjunction It is obviously advantageous to be able to bring the clinician and the radiologist so close together, especially when it is noted that even expert whole-time radiologists admit that by skiagraphy alone the differential diagnosis of pulmonary conditions is often impossible indeed, the number of such cases has been placed as high as 40 per cent Moreover a radiologist who has no clinical experience or is not regularly engaged in clinical work is often greatly handicapped in endeavouring to interpret what he sees This disadvantage can however be overcome to some extent if the radiologist and clinician actually meet and discuss cases of special difficulty or interest

Finally as soon as a diagnosis is made a report is sent to the patient's doctor, and, if of sufficient interest, a few days later a reduced print of the skiagram There is reason to believe that these prints are appreciated and

help to encourage the use of our radiological clinic This in brief illustrates the procedure I have adopted for over fifteen years

Conclusion

Medical practitioners are gradually recognizing the help that chest skiagraphy can give but they sometimes have difficulty in obtaining a patient's consent to undergo examination This reluctance is usually related to the popular idea that tuberculosis is necessarily incurable The wise and tactful practitioner will explain that the object of skiagraphy is to make sure that the patient is all right or at least only suffering from disease in an early stage Driving and other tests are becoming more common among the general public and a few minutes simple explanation will often reassure a timid patient

Skiagraphy of the chest is so important for accurate diagnosis that it can seldom be omitted with safety It is the most valuable single factor in the diagnosis of pulmonary disease

THREE CASES OF CL WELCHII INFECTION FOLLOWING ABORTION

BY

R Y DAWBARN, M D,

Pathologist Walton Hospital

AND

BRYAN WILLIAMS M D, M C O G, F R C S Ed

Senior Assistant Medical Officer Walton Hospital

This condition appears to be uncommon or at any rate infrequently recognized, and we hope therefore that it may be of value to record three more cases In his very thorough review of the whole question of post abortal and puerperal gas gangrene Hill (1936) was able to find only eighty four cases described in the literature to which he added a further series of thirty cases of his own

The interest to us has been twofold first as regards the differential diagnosis and secondly by reason of the rapidly fatal course of the illness In both of the cases septicaemia the onset was so sudden and the manifestations were so dramatic that chemical poisoning was suspected These suspicions were strengthened by the fact that both patients had been taking large doses of pills presumably with the object of procuring abortion We record the more recent of these two cases first because the diagnosis was confirmed bacteriologically The other case occurred in 1934 and though we feel sure now of the diagnosis bacteriological confirmation is lacking The third case also ran a fulminating course although the clinical picture was different and the diagnosis was made soon after the admission of the patient to hospital

Case I

A married woman aged 30 was admitted to Walton Hospital at 2.30 p m on December 13 1937 Her three previous pregnancies had been normal Her last menstrual period was on October 20 During the previous week she had been taking pills of iron and aloes twenty in all At 2 a m on the day of admission she was seized with severe lower abdominal pain and vomiting At 11 a m there was considerable vaginal bleeding

On admission the patient showed signs of severe shock and her pulse was feeble Her temperature was 97 pulse 96 and respirations 26 The lower abdomen was extremely tender and rigid There was slight vaginal bleeding and on examination the cervix was closed and the uterus enlarged to about the size of a sixteen weeks pregnancy There was general pelvic tenderness A provisional diagnosis of either septic abortion with pelvic peritonitis or of ectopic pregnancy was made

At 6 p m her general condition appeared to have improved slightly The lower abdomen and face had become flushed About 2 c cm of thick dark brown urine was withdrawn by a catheter microscopically this showed no intact red blood cell By 8 p m however her condition had become much worse There was now an extensive bluish flush on the abdomen and face On vaginal examination the uterus seemed to be larger Further catheterization produced only a few drops of almost black urine Blood taken from a vein showed evidence of haemolysis the plasma being the colour of burgundy Death occurred at 9.10 p m or within seven hours of admission and just over nineteen hours after the illness began Shortly before death a crackling sensation was elicited on palpation of the lower abdomen

POST MORTEM EXAMINATION

The surface of the body showed a dusky bronzed hue most marked on the face and abdomen The deeper parts were very dark and slight crepitation was noticed on cutting through the tissues of the neck and uterus The lungs were very congested There was haemolytic staining of the blood vessels and endocardium The kidneys weighing 6 and 6½ oz. were almost black The spleen was about twice the normal size and was tense and nearly black Frothy fluid exuded from the cut surface The liver showed cloudy swelling with a little gas under the capsule The stomach revealed no sign of chemical poisoning The intestines were pink and were not ulcerated The uterus was greyish black 4½ by 3½ inches and very slightly crepitant A little blood and necrotic material was found in the uterus and was kept for section No evidence of mechanical injury was found The peritoneum contained dark-coloured fluid A corpus luteum was present in the right ovary

Films made directly from the peritoneal fluid and splenic pulp showed great number of Gram positive bacilli resembling *Cl welchii* Cultures were made from the spleen anaerobically and a good growth of *Cl welchii* was obtained which gave a characteristic stormy reaction in milk after incubation overnight

Sections were cut of the uterus and its contents the liver and kidney and were stained by haemalum and eosin and by Gram's method The uterine contents consisted of necrotic decidua blood many Gram positive bacilli and other organisms No placental villi were found The uterine wall showed evidence of infection and there were many dilated vessels containing infected clot The muscle took the stain badly and parts appeared to be almost necrotic Numerous Gram positive bacilli were seen throughout especially in the blood vessels The appearance of the kidney was suggestive of advanced post mortem change although the necropsy was performed well within twenty four hours of death In some areas the nuclei remained quite unstained and there was marked degeneration of the glomeruli and cells lining the tubules In addition to this many of the tubules were filled with brownish material which was evidently derived from the blood as a result of the haemolysis The liver cells showed extreme degeneration in many parts amounting to necrosis The stain for organisms showed Gram positive bacilli in both liver and kidney

Case II

The following notes are taken from the records of Walton Hospital One of us saw this patient before she died and

also reported on pieces of tissue removed at necropsy for histological examination

A married woman aged 23 was admitted to Walton Hospital at 5.20 a.m. on August 25, 1934. She had had two previous pregnancies. Her last menstrual period was on June 24. The patient admitted having taken pills to bring on an abortion but denied the use of any other method. Vaginal bleeding had begun at 5 p.m. the previous day, followed by abdominal pain at 11 p.m. On admission she complained of constant and severe lower abdominal pain. The abdominal wall was held rigid. Her temperature was 101°, pulse 96 and respirations 28. On vaginal examination some bleeding was noted, and the uterus seemed enlarged to about the size of a ten weeks pregnancy but was difficult to feel. On catheterization about 1 drachm of very dark urine was obtained. This contained albumin and haemoglobin but no red blood cells. Increasing jaundice and cyanosis were noted up to the time of death which occurred at 1.50 p.m. or eight and a half hours after admission and less than twenty one hours after the beginning of symptoms. It was then thought that death might have been due to some chemical poisoning producing haemolysis, such as potassium chlorate.

POST-MORTEM EXAMINATION

The surface of the body showed a dusky red colour with many small red spots mainly on the face and the backs of the arms and legs. The pleural, pericardial and peritoneal cavities contained dark blood stained fluid. The external appearance of the liver was normal but the cut surface showed a yellowish brown colour. The kidneys were both of normal size but were intensely congested and cyanosed so that they looked almost uniformly black. The spleen was of normal size and consistency but was darker than normal. The pelvic retroperitoneal tissues were deeply blood stained but there was no haematoma. The uterus was about the size of an eight weeks pregnancy. There were no signs of injury to the vagina or cervix, the latter was slightly open. There was no foetus in the uterus but a well marked decidual reaction was noted. The right ovary contained a corpus luteum. The alimentary canal showed no evidence of corrosive poisoning. Samples of various organs were sent to the Liverpool City analyst to be examined for poisons.

In the sections of the kidneys the tubules and Bowman's capsules were choked with haemolysed blood. The liver showed cloudy swelling and Gram's stain revealed a few Gram positive bacilli. In the uterus no placental villi were to be seen, there was evidence of infection and many dilated blood spaces. Examination for organisms showed many Gram positive bacilli, some being inside the blood vessels.

Unfortunately the bacteriological report on the blood culture which was taken during life is incomplete. It merely states that Gram positive spore-bearing bacilli were grown and the culture was not an anaerobic one.

The Liverpool City analyst found no evidence of chemical poisoning, and the only diagnosis that could be made at the time was that the patient had died from some haemolytic toxin of unknown nature. Although the matter was left doubtful the possibility of anaerobic septicaemia was considered when the histological sections were being examined. Owing to the fact that no gas was noticed in the liver or other tissues at the necropsy it was thought then that the presence of Gram-positive bacilli in the sections was a post mortem phenomenon and the spore-bearing bacilli in the blood culture were looked upon as contaminants. The last assumption may have been correct in any case it is unlikely that the organisms in the blood culture were true *Cl. welchii*.

On the other hand in spite of the lack of bacteriological evidence on looking back we are convinced that this was also a case of anaerobic septicaemia, and we base our diagnosis on the following facts: (1) the sudden onset of the illness in association with an abortion, the abdominal pain, the ictero-cyanosis, and the haemolysis *in vivo* are typical of an acute "anaerobic septicaemia" as described by Hill, (2) the lack of evidence of chemical poisoning, (3) the striking similarity of this case with the first one, (4) the presence of Gram-positive bacilli in the post-mortem sections. The absence of gas from the tissues had originally appeared to provide a reason against the diagnosis of "anaerobic septicaemia," but this now appears to be invalid, as in Hill's series of cases it was unusual to detect gas in the tissues before death.

Case III

A widow aged 27 was admitted to Walton Hospital at 10.30 a.m. on April 1, 1938. Her two previous pregnancies had been normal. Her last menstrual period was on November 6, 1937. She denied that any interference had been carried out but admitted having taken salts by mouth. Two days before admission vaginal bleeding followed by abdominal pain had started and a small foetus had apparently been passed shortly before admission. The patient was very collapsed when admitted, her pulse was 65, her temperature 96°, and respirations 20. The blood pressure could not be registered. On abdominal examination the fundus had almost the height and feel of a full time fundus after delivery. A small cord was seen at the vulva. On pressure on the fundus a slight offensive loss of dark blood together with gas was observed which at once raised the suspicion of a *Cl. welchii* infection. A direct smear of this showed coliform bacilli, streptococci and large Gram positive bacilli similar in appearance to *Cl. welchii*. After intravenous gum glucose saline her condition improved slightly. There was no further bleeding. At 8 p.m. the same evening however she became much worse and crepitation of the fundus was now felt. The advisability of hysterectomy was considered but this operation was held to be unjustifiable owing to her poor condition. It was thought however that removal of the placenta might improve her chance of recovery by emptying the uterine cavity of dead tissue and by decreasing the absorption of toxins and organisms. This was therefore carried out under anaesthesia. The placenta was adherent but there was no undue bleeding. In spite however of blood transfusion and the injection of prontosil soluble and gas gangrene serum the patient died at 3.10 a.m. the following day or within seventeen hours of admission and three days after the start of the abortion. Blood culture before death showed *B. coli* only but *Cl. welchii* was cultured from the lochial discharge.

POST-MORTEM EXAMINATION

Post-mortem examination revealed some blood stained fluid in the peritoneal cavity. The uterus was large for the stage of pregnancy and was dark red and covered with lymph. Its walls crackled owing to the presence of gas. No signs of any injury of the vagina or cervix were seen. There were some bubbles of gas in the retroperitoneal tissues but otherwise no gas was noted in the liver or elsewhere. Apart from some slight staining of the aorta with blood pigment there were no other gross changes or signs of haemolysis. Sections of the placenta and uterine wall showed many Gram positive bacilli resembling *Cl. welchii*.

This third case presents some points of contrast with the other two cases, although its course while under observation in hospital was almost as fulminating. The diagnosis was more obvious during life owing to the presence of gas in the vaginal loss and the finding in smears, of organisms morphologically similar to *Cl. welchii*. In addition however, the previous occurrence of the first of these three cases had directed our attention to this kind of infection. Moreover, the infection was at first localized to the uterus as shown by the absence of *Cl. welchii* from blood cultures taken during life and haemolysis was found to be almost completely absent at the post-mortem examination. Strains of *Cl. welchii* vary

in their capacity to produce haemolytic and other toxins In the first two cases the rapidity of the haemolysis was such as to suggest chemical poisoning whereas in the third the production of gas was the most obvious feature and more readily suggested the diagnosis

In the two cases of septicaemia the infection was of a particularly fulminating nature the patients dying nineteen and twenty one hours respectively from the onset of symptoms Hill describes one case in which death occurred within sixteen hours after interference but in most of his cases the duration of life in those that were fatal was considerably longer It seems probable from our experience that in some of these fatal cases the correct diagnosis is not made and that some other factor such as shock or chemical poisoning is held responsible for the patient's condition

In none of the three cases was the mode of infection determined In every instance the pregnancy was an unwanted one and all patients admitted having taken drugs with the object of procuring abortion so that it seems probable that instrumental interference had also been attempted

The treatment of this type of infection has been discussed in some detail by Hill but it seems unlikely that any method would have been successful in these fulminating cases at the time they first came under observation

Summary

Three fatal cases of infection with *Cl welchii* following abortion are described In two of these the infection was a fulminating one in which the main feature was the occurrence of haemolysis and a correct diagnosis was not made before death the condition being attributed to chemical poisoning The third case was one of a rapidly fatal infection of the uterus

We should like to express our thanks to Dr H H MacWilliam medical superintendent of Walton Hospital and Mr St George Wilson consulting obstetrician and gynaecologist for permission to record these cases

REFERENCE

Hill Arthur M (1936) *J Obstet Gynaec Brit Emp* 43 201

The eighth conference of military medicine and pharmacy in Luxemburg was distinguished by a very detailed discussion of systematic radioscopy in land forces inaugurated by the Belgian French and Swiss delegates. It was decided that the administration of the International Committee of the Congresses of Aviation and Health should henceforth pass into the control of the conference of military medicine and pharmacy With regard to the statutes of the permanent committee of the congress it was apparent that now that the sixteenth International Red Cross Conference was to discuss the revision of the Conventions of Geneva and The Hague in respect of the sick and wounded of armies in the field and that the proposals of the International Committee of Military Medicine and Pharmacy had been referred to diplomatic discussion these two objectives had been achieved This success which was announced with great enthusiasm would now permit the International Committee to devote its activities to its primary purpose—namely the science of military medicine The commission of medical jurisprudence might have been accordingly dissolved its work having thus been crowned with success *But the problem of the protection of civil* populations was still the focal point of discussion throughout the world and it was agreed that this subject might still preferably occupy the attention of the commission independently of the International Committee

ON CERTAIN PHASES IN THE LIFE HISTORY OF THE POLYMORPH LEUCOCYTE

THE INFLUENCE OF CELL ACTIVITY ON THE NUMBER AND ARRANGEMENT OF THE NUCLEAR LOBES

BY

C J BOND, C M G, F R C S

Arneth (1904) Schilling (1929) and other observers have attributed the multilobular condition of the polymorph nucleus to increasing age of the cell while others—for example Price Jones (1933)—have not accepted this conclusion In the following communication I shall hope to show *that previous activity on the part of the cell* as represented by amoeboid movement and phagocytosis may be an important factor in determining the number of nuclear lobes or in other words the shift to the right in the Arneth count

Chart I

This curve gives a count of *the total number of nuclear* lobes in 100 polymorph leucocytes taken from the blood of the same individual at the same time but under different conditions (*a*) the normal blood film (*b*) the same blood after incubation (*c*) the same polymorph cells when re-incubated after standing at room temperature for six hours

In film (*a*) the total number of lobes per 100 cells was 271
(*b*) 303
(*c*) 394

This rise in the number of nuclear lobes in 100 cells represents a considerable shift of the Arneth count to the right It suggests that the increased work done by the incubated cells over that of the resting blood cells and the still greater activity of the reincubated cells after a period of rest are responsible for the rise in the number of nuclear lobes in the activated and reactivated cells

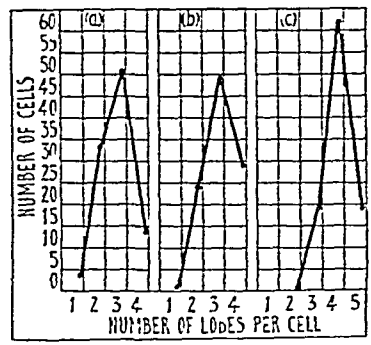

CHART I.—(*a*) Normal blood film 271 lobes in 100 cell (*b*) Incubated blood film 03 lobes in 100 cell (*c*) Re incubated blood film 394 lobes in 100 cells

Chart II

This gives the total number of nuclear lobes in 100 polymorph cells in two cases of pernicious anaemia In Case 1 the polymorphs constituted 31 per cent and haemoglobin 55 per cent and in Case 2 they were 50 per cent and 72 per cent respectively Marked leucopenia was present in both cases The number of nuclear lobes per 100 cells was 472 in Case 1 and 455 in Case 2 —In both cases this marked increase in the number of nuclear

lobes per cell coexisted with a considerable reduction in the total leucocyte blood count

The question arises whether this shift to the right in the Arneth count was due to the greater demand on the activity of the reduced number of cells or whether it depended on the circumstance that fewer young polymorphs—that is, cells with the average number of two or three lobes—were being discharged into the blood stream from the bone marrow It is a significant fact that in both cases of the disease a number of cells contained as many as six or seven nuclear lobes

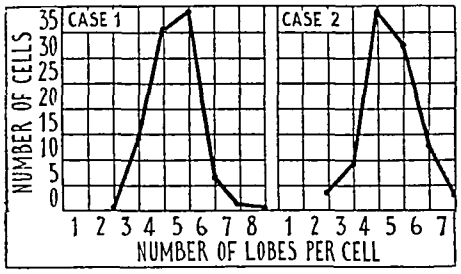

CHART II—Pernicious anaemia Case 1 polymorphs 31 per cent haemoglobin 55 per cent 472 lobes in 100 cells Case 2 polymorphs 50 per cent haemoglobin 72 per cent, 455 lobes in 100 cells

Chart III

This chart gives the total number of nuclear lobes in 100 polymorph cells in (*a*) a blood film (*b*) an incubated pus film, (*c*) a reincubated pus film The films were all taken from a patient with cerebrospinal meningitis, and the pus was obtained from the cerebrospinal fluid by puncture

Film (*a*) gives a total of	273 lobes in 100 cells
(*b*)	335
(*c*)	422

Here again the film from the pus cells—that is, cells which have emigrated from the blood vessels into the cerebrospinal fluid—shows a greater number of nuclear lobes than the corresponding cells circulating in the blood stream while the reincubated pus cells after standing at room temperature show a still greater increase in the number of lobes

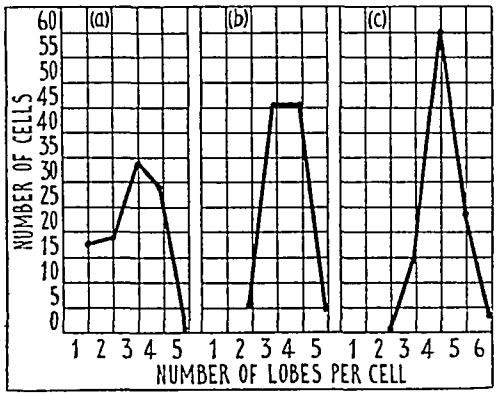

CHART III—Cerebrospinal meningitis (*a*) Blood smear 273 lobes in 100 cells (*b*) Pus smear 335 lobes in 100 cells (*c*) Pus reincubated 422 lobes in 100 cells

Cell Emigration

Now the living pus cell is a polymorph leucocyte which has passed through the capillary wall into the tissue spaces or into a serous cavity or on to the surface of a granulating wound or as in this case into the cerebrospinal fluid To enable it to carry out this migratory journey the cell must become plastic The nuclear mass which in the resting cell consists of two or three lobes aggregated together in the centre of the cell, undergoes marked changes in shape The nuclear lobes become thinner and more widely separated, like a string of sausages when pulled apart, within the common enveloping skin In some actively moving cells the fine strand of chromatin, or nuclear material connecting one lobe with another, may break, and one lobe may thus become disconnected from its fellow, though still enveloped by the same cytoplasmic covering Metchnikoff (1893) has drawn attention to the segmental character of the polymorph nucleus as an aid to diapedesis and emigration

It is also historically interesting to note that T Wharton Jones (1853, 1884, 1887) strenuously rejected the emigration theory put forward by Cohnheim, both in his writings and in his lectures, one of which, given at University College, London, in 1878, I attended Wharton Jones regarded the nucleus of the polymorph cell as composed of a single mass, and he looked upon the multilobular form—which, for instance, is revealed by treatment of the cell with diluted acetic acid—as an artefact Probably this misconception in regard to the shape of the normal polymorph nucleus may have made it difficult for Wharton Jones to accept the possibility of diapedesis and emigration through the capillary wall

The changes in shape of the nucleus which occur during emigration in the living body can also be demonstrated experimentally as taking place outside the body (C J Bond, 1924) Thus, if a drop or two of blood drawn from the finger be incubated in a Ponder's chamber, the cells which emigrate from the red clot and settle on the glass floor will show similar changes in shape of the nucleus If, further, these activated cells are allowed to stand in the closed chamber at room temperature for a short time the string of nuclear lobes tends to aggregate, or even in some cases to fuse into two or three lobes and the cell resumes the rounded shape of the "resting cell But it must be remembered that not only the *resting* but the *dead* polymorph are both *round cells* The latter like the dead pus cell, can, however, be distinguished from the living resting cell by their reluctance to take up stains like Janus green and by inability to reassume amoeboid movement or phagocytosis when stimulated

E Grevelink (*These Paris* 1938 No 24) who records two cases in unmarried women, aged 32 and 38 with a review of the literature states that feverish attacks which may be called ovarian fever occur in the female sex between puberty and the menopause The most frequent are premenstrual in which the evening temperature hardly ever exceeds 100° or 100·6° F The commonest symptoms are asthenia, cardio vascular disturbances, and various nervous or psychical troubles The attacks cease with the natural or artificial menopause The patients must be examined for the presence of a hyperfolliculin syndrome which often occurs and justifies treatment by a hormone which neutralizes the excess of folliculin especially an extract of the corpus luteum or mammary gland or a testicular extract In one of Grevelink's cases the fever was dispelled by stimulation of the ovaries or mammary gland by diathermy

CHEMOTHERAPY IN GONORRHOEA

A PRELIMINARY REPORT ON THE USE OF 2-(*p*-AMINOBENZENESULPHONAMIDO)PYRIDINE M & B 693

BY

F. J. T. BOWIE, M.B., Ch.B., D.P.H.

Chief Venereal Diseases Officer, Public Health Department, Aberdeen

One of the most intriguing characteristics of medical research work lies in the possibility that overnight a remedy of unbelievable therapeutic potency may be produced and that the millennium of gonorrhoea control may be close at hand. Thus writes Parran (1937) in respect of what may emerge from sulphanilamide in the control of gonorrhoea.

The introduction of 2 (*p* aminobenzenesulphonamido) pyridine M. and B. 693 is an event which bids fair to produce a notable advance in the attack on the gonococcus. Reference has already been made to some of its results in experimental work in mice by Whitby (1938) in pneumonia by Telling and Oliver (1938) and Evans and Gaisford (1938a, 1938b) and in the treatment of gonorrhoea by Lloyd, Erskine and Johnson (1938). The following report, essentially of a preliminary character, supports the findings published at a similar stage of experimental treatment by Lloyd *et al.* and is of considerable interest in its clinical bearings.

Analysis of Cases Treated

Through the courtesy of Messrs. May and Baker, Ltd., who are kindly maintaining a supply of M. and B. 693, it is now possible to give some details of thirty-one cases of gonorrhoea treated orally by the drug, thirty being male patients and one a female case of gonococcal ophthalmia neonatorum. Of the thirty male cases twenty-seven were of acute anterior urethritis and three of urethritis and prostatitis, twenty-three of the anterior and one of the prostatic types were fresh untreated cases, the other four and two respectively having resisted previous treatment by urethral lavage, benzyl sulphanilamide and or sulphanilamide and in one case by gonococcus antitoxin.

Taking the fresh cases first (twenty-three of acute urethritis and one of additional prostatitis) the results were as follows: six cases were gonococcus-negative in one day, ten in two days, six in three days, one in eight days. One patient showed gonococci up to the seventeenth day, but in his case there was reason to believe that he was not taking his M. and B. 693 regularly. Of the six previously treated (four of urethritis and two of prostatitis) five were gonococcus-negative in two days and one in three days. Thus of thirty cases six were negative in one day, fifteen in two days, seven in three days, one in eight days, and one in seventeen days. (These figures err if anything in favour of the gonococcus, if such an expression may be used, as the seven cases given as being negative in three days were not seen till that period of treatment had elapsed and may have been negative before, but for purposes of these notes are given as three-day results.) The cases were controlled by direct staining and/or culture of pus and urethral secretion at or up to the periods stated. If such pus or secretion was not available, as occurred in a number of cases very rapidly, a centrifuged urinary deposit was investigated by similar methods. Gonococcus-negative means the absence of gonococci by any of these methods of examination.

While these negative results were observed and while most patients when asked would answer that their discharge had disappeared in one day or two days, varying degrees of muco-pus or mucus from the urethra and threads in the urine were noted for periods differing from three to even eighteen days and showing pus cells up to that time. In most cases however it was with difficulty that any urethral discharge or secretion could be found after a week. Though final tests of cure have not yet been applied, none of the thirty cases has shown either clinical or bacteriological signs of relapse in the two to four weeks during which they have been under observation since cessation of treatment. It is worthy of note that so far as could be ascertained not one of the anterior cases has developed any invasion of the posterior urethra. The prostatic cases likewise did not result in further complications.

The Dosage Used

The dosage of M. and B. 693 in twenty-three patients was 3 grammes daily for four to seven days, then 1·5 grammes daily for a similar period in most cases. At first a few were treated for a longer period, probably quite unnecessarily. A trial of 1·5 grammes daily from the commencement of treatment was made in seven cases. Of these five were gonococcus-negative in two days, one in eight days, and one not till the seventeenth day. The total dosage varied actually from 4·2 to 14 grammes. The average amount necessary is yet undecided, but it would appear that anything from 15 to 25 grammes suffices, and the suggestion is made that the initial dose should not be less than 3 grammes daily. The following dosage is to be tried in uncomplicated cases of urethritis: first day 4 grammes, second and third days 3 grammes per day, fourth to seventh day inclusive 1·5 grammes daily. Urethral lavage (potassium permanganate 1 in 8,000) was given to twenty-four cases mainly for psychological reasons, but of six patients who did not have anything other than M. and B. 693 five were gonococcus-negative in two days and one in three days. The duration of infection—which varied from thirteen weeks to one day—prior to treatment did not seem to have any influence on the result of M. and B. 693.

Toxic results were noted in seven of the thirty patients: nausea in two, dizziness in two, headache and lassitude in one, drowsiness in one, and breathlessness in one. All were slight. The last mentioned showed some methaemoglobinaemia, and in this patient only was it deemed advisable to withdraw the drug when his breathlessness promptly ceased. By this time however the desired effect upon his infection had been accomplished. Cyanosis was not seen in any case.

A Case of Gonococcal Ophthalmia Neonatorum

A case of gonococcal ophthalmia neonatorum remains to be mentioned, and for permission to include it thanks are due to Dr. Michie, senior resident medical officer at the City Hospital, Aberdeen. A female infant infected in one eye had been treated actively with boric lavage and silver nitrate and had also received prontosil. At the end of seventeen days the notes read: Making very slow progress; needs intensive treatment. She was then given 0·25 gramme M. and B. 693 thrice daily for three days. The notes then read: Sudden almost dramatic improvement. Conjunctiva clear and only minimal pus. This occurred in forty-eight hours. A culture and smear examined one day after the cessation

of treatment were free from gonococci and from pus cells The child was discharged three days later

Comment

It is not intended to make any comment meantime other than that, of three preparations—benzyl-sulphanilamide, sulphanilamide, and M and B 693 the first and second having been tried extensively in the Aberdeen clinic—the last is the swiftest in action So far it would appear to be a highly efficient and comparatively safe drug in the doses which apparently suffice to deal with the gonococcus But out of this very efficiency there may arise the necessity, for obvious reasons of strict control in the sale and distribution of such a preparation It is hoped that at some future date a more detailed report may be made on the use of M and B 693 in the treatment of gonorrhoea

X-RAY PELVIMETRY

A SIMPLE METHOD FOR MEASURING THE PELVIC BRIM

BY

A. ORLEY, M.D., F.B.A.R.

External pelvimetry is still practised by obstetricians and general practitioners, but probably more as a matter of routine than from the conviction that an accurate knowledge of the internal pelvic measurements will be gained Even internal pelvimetry is unreliable Besides, it is not easy to apply, and it is often painful or disagreeable to the patient

In a recent article on the true conjugate and pelvimetry J Howkins (1938) arrives at the conclusion that the clinical measurement of the true conjugate is either impossible in practice or inaccurate when measured in all but cases of severe pelvic contraction, that a genuine attempt to measure it in a primipara demands a full anaesthetic that the location of the sacral promontory requires practice and skill, and is valueless unless performed by one familiar with pelvic examination and that the measurement, when truthfully obtained, is open to considerable experimental error, in addition to errors due to the particular anatomy of a given patient such as the depth and inclination of the symphysis pubis

It is mainly for the above reasons that radiologists have striven since the early days of the x ray era to make use of radiography for measuring the pelvic brim The first radiography of the pelvis (of a corpse) was performed in 1896 by Varnier and Chappuis and required an exposure of three hours In 1897, at the twelfth International Congress of Medicine in Moscow, Professor Budin showed an excellent radiograph of an oblique pelvis of Naegele this required an exposure of three-quarters of an hour At the same congress Professors Pinard and Varnier reported results of the radiological investigations of the female pelvis It is possible, they said accurately to diagnose in doubtful cases the symmetry or asymmetry of the pelvis the site and degree of the asymmetry, the presence or absence of atrophy of the sacrum or of sacro iliac ankylosis ' They estimated the various diameters of the pelvic brim by comparing the obtained radiograph with standard radiographs of dried pelves

Since then the evolution of x ray pelvimetry has followed a very devious and complicated path (Orley, 1933) Most ingenious devices and methods for measuring the pelvic brim have been invented, and then discarded because they were too complicated, too expensive, or unreliable This paper deals with one method of x ray pelvimetry only—namely, that which was originally suggested in 1897 by Albert, was rediscovered thirty years later by R E Roberts (1927) of Liverpool and simplified by H Thoms

Description of Method

The technique described later differs somewhat from that suggested by Thoms The principle, however, is the same Briefly speaking, the method consists in placing the patient on the radiographic couch in such a way as to bring the plane of the pelvic brim parallel to the plane of the radiographic film For this purpose the tip of the fourth lumbar spine is marked on the skin with a dermographic pencil or by a strip of adhesive plaster The patient is then seated on the x-ray couch in a semi reclining position, so adjusted that the tip of the spine of the fourth lumbar vertebra is at the same horizontal level as the upper border of the symphysis pubis This is carried out in the following way one leg of a pair of callipers is placed on the top of the x ray couch in front of the symphysis pubis between the patient's thighs and the callipers are spread until the tip of the other leg of the calliper is at the level of the upper border of the symphysis pubis The inclination of the patient's spine is then so adjusted that the distance between the top of the couch and the skin mark corresponding to the tip of the fourth lumbar spine is equal to the spread of the callipers

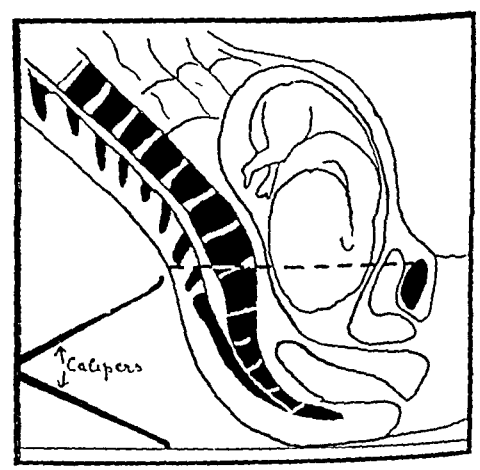

FIG. 1—Diagram showing that when the tip of the spine of the fourth lumbar vertebra is at the same horizontal level as the upper border of the symphysis pubis the line which joins the two passes through the promontory

Some workers dispense altogether with the marking of the tip of the fourth lumbar spine and instead measure only the distance of the upper border of the symphysis pubis to the top of the table, placing the patient in such a way that her spine forms an angle of 57 degrees with the plane of the x-ray couch The pelvic brim

should then be parallel with the top of the x ray couch A radiograph of the pelvis taken in this position shows the projection of the pelvic brim slightly larger than natural size

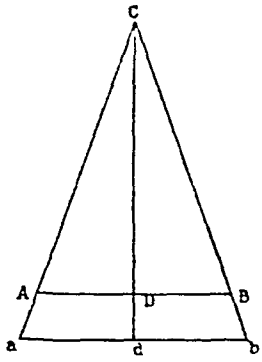

Fig 2 —Diagrammatic representation of the antero posterior diameter of the pelvic brim AB of its radiographic projection ab and of the central ray Cd

The radiographic projection ab of the true conjugate diameter is larger than the actual diameter AB owing to the distortion of the radiographic image caused by the spread of the x ray beam It is obvious that any object placed in the imaginary plane of the pelvic brim would undergo the same degree of radiographic distortion as the brim itself Therefore if after having radiographed the pelvic brim we remove the patient from the x ray couch and leaving the tube in the same position substitute for the imaginary plane of the pelvic brim a perforated sheet of lead supported on two adjustable supports and give a flash exposure we shall obtain on the x ray film a number of black dots corresponding to the perforations in the sheet of lead If these perforations were 1 cm apart the distance between each two adjoining dots on the film would correspond to 1 cm — in other words the distance between two adjoining dots on the film corresponds to a corrected centimetre and any pelvic diameter can be read directly on the film by counting the number of corrected centimetres corresponding to this diameter

The perforated lead sheet can be made at home A sheet of lead 12 by 12 inches and 2 mm thick is ruled out in square centimetres and fine perforations are drilled at each intersection of the transverse and vertical lines The sheet is then mounted on a piece of plywood in order to keep it firm A flash exposure given through it results in a number of small black dots on the film

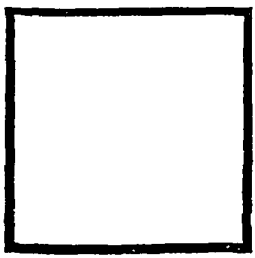

Fig 3 —The perforated sheet of lead

For measuring the distance between the tip of the fourth lumbar spine (or of the upper border of the symphysis pubis) and the top of the x ray couch a pair of ordinary internal callipers are used These can be obtained from any ironmonger for a few shillings

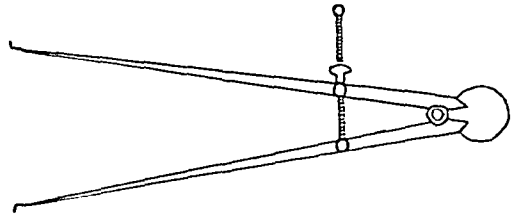

Fig 4 —The callipers

The adjustable supports on which the perforated lead sheet rests can also be easily made by a local mechanic Roughly speaking each support consists of an iron base 3 by 4 inches and about half an inch thick from the centre of which rises an iron rod about 8 inches long On this rod a horizontally placed piece of angle iron slides by means of a collar provided with a set screw

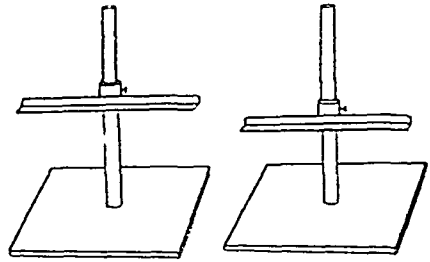

Fig 5 — Adjustable supports for the sheet of lead

After the pelvis has been exposed the distance between the horizontal piece of angle iron of each support and the top of the table is adjusted to correspond to the spread of the callipers and the perforated sheet of lead is placed on the horizontal angle irons in the imaginary plane of the pelvic brim By using a focus film distance of 110 cm and by centring the tube over the inner border of the symphysis pubis the maximum possible error in the measurements is reduced to about 3 mm for true conjugates of over 10 cm wide For smaller diameters the error is still smaller

Commentary

The method is extremely simple and can be carried out even with small x ray plants as radiographic speed is not essential a Potter Bucky diaphragm however is indispensable The output of the plant may be as low as 10 mA and provided the penetration is adequate (somewhere in the neighbourhood of 90 kV) serviceable radiographs can be obtained with exposures of thirty to forty seconds In advanced pregnancy longer exposures may be required

As with the patient sitting the thickness of the tissues is much greater behind than in front of the abdomen the region of the pubis tends to be too dark on the radiograph This can easily be remedied by shielding during part of the exposure the anterior half of the abdomen by means of a sheet of lead which is kept slightly moving in order to prevent it casting a sharp shadow on the film

X-ray pelvimetry can be carried out even during actual labour Where the head is in the pelvic brim the radiograph also shows the relative sizes of the head and brim A number of obstetricians apply x-ray pelvimetry as a routine in all primiparae The expense and trouble are small in comparison with the saving of lives which might otherwise be lost through unnecessary or too-long-delayed Caesarean section in cases of suspected contracted pelvis, which constitutes the most important and most frequent indication for Caesarean section

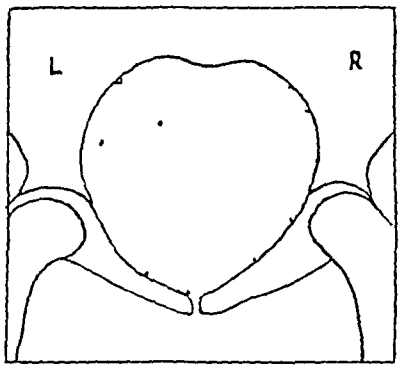

FIG 6—Mrs M aged 28 Had Pott s disease of spine at age of 16 A flat pelvis was diagnosed and first child was delivered by Caesarean section Now wants another child but not unless it were possible *per vias naturales* X-ray pelvimetry shows A-P diameter 12 cm transverse diameter 12½ cm slight asymmetry of pelvis She was advised that there would be no need for Caesarean section for the next child

The mortality from this operation according to a statistical analysis based on 3,686 cases (Banister, 1935) is 6 6 per cent, as compared with a gross puerperal mortality of 0 45 per cent In other words, the mortality from Caesarean section is roughly fifteen times greater than the average mortality following childbirth But, apart from this, x ray pelvimetry, carried out as a routine, brings in an element of reassurance to both patient and doctor, a factor of no small importance in primiparae

R Debre M Lamy M Mignon and J J Welti (*Presse méd* 1938 **46** 1011) who record two illustrative cases in a boy aged 11 and a girl aged 8, state that whooping-cough is not merely characterized by a slight catarrh of the upper respiratory tract but is accompanied by a pulmonary lesion In other words whooping cough is a disease of the lungs and runs a subacute course more often than is generally supposed The pulmonary lesions explain the frequency of certain findings even in the mildest attacks especially the presence of fever certain auscultatory signs and the long duration of the disease as well as the frequency and importance of radiological changes in the lung On the right side the usual appearance is that of a roughly triangular shadow in the sub hilar region while on the left the cardiac shadow is blurred These changes which are frequent in mild attacks and almost constant in severe whooping cough may be mistaken for tuberculosis or abscess of the lung and diagnosis may not be possible without the assistance of lipiodol

Clinical Memoranda

Pneumococcal Meningitis treated with Sulphanilamide: Recovery

The number of recorded cases of pneumococcal meningitis which have recovered is still so small that the following case in which recovery followed treatment with sulphanilamide appears worth reporting

CASE RECORD

A boy aged 5 years was admitted to the Royal Hospital Wolverhampton, on April 1, 1938, complaining of right sided earache for one week there was no history of previous ear disease An acute otitis media was found Myringotomy was performed, and this was followed by a profuse discharge of pus The condition subsided, and the child was discharged on April 9

He was readmitted on April 14, complaining of severe frontal headache for two days and vomiting the previous d On examination he was pale, listless, and very drowsy temperature 101° F pulse 130 There was slight neck stiffness, Kernig s sign was positive, and photophobia was present The right ear drum was retracted there was no ear discharge and no mastoid tenderness The left ear was apparently normal

Lumbar puncture was performed and 20 c cm of turbid fluid withdrawn, in the absence of a bacteriological diagnosis 10 c cm of anti-meningococcal serum was given intrathecally, laboratory examination revealed a purulent fluid films showed abundant pus cells and Gram positive diplococci Cultures yielded a pure growth of pneumococci Globulin was found in excess, protein amounted to 0 24 per cent, chlorides to 0 66 per cent and sugar to 0 018 per cent Oral treatment with sulphanilamide was immediately started, one tablet being given four-hourly Lumbar puncture was repeated once daily on the 15th, 16th, and 17th On each occasion pneumococci were grown on culture from the cerebrospinal fluid but the turbidity appeared to be decreasing Cell counts were not made because of clot formation in the cerebrospinal fluid

On the 16th—that is the third day of treatment—the temperature fell by crisis to 97 6° F The child was no longer drowsy and was playing with his toys On the 18th eruption was just becoming evident and the sulphanilamide was discontinued Dosage to this point was twenty one tablets (10 5 grammes) The temperature rose sharply to 101 5 F on the 20th, with recurrence of neck stiffness and drowsiness Lumbar puncture yielded a clear fluid which was sterile on culture The sulphanilamide was restarted—one tablet being given four-hourly for three days, to the total of twelve tablets (6 grammes)—stopped as the cyanosis had become intense and then after an interval of two days given for a further three days to a total for the last course of thirteen tablets (6 5 grammes)

The laboratory reports on the cerebrospinal fluids obtained by subsequent lumbar punctures are as follows

April 24—Clear colourless fluid cells 5 per c mm Films show lymphocytes only, globulin in excess, protein, 0 07 per cent chlorides 0 73 per cent, sugar, 0 043 per cent No growth on culture

April 27—Clear colourless fluid cells 2 per c mm globulin in excess no growth on culture

April 29—Clear colourless fluid, cells 2 per c mm globulin in excess no growth on culture

May 5—Clear colourless fluid cells, 2 per c mm all lymphocytes no excess of globulin, no growth on culture

The temperature fell on the 21st after discontinuance of the sulphanilamide and except for an occasional rise to 99 F thereafter remained normal In retrospect it appears that the

rise of temperature on the 20th was probably reactionary and due to the drug that actually by that time the infection had been successfully combated and that the further courses of sulphanilamide were not really necessary From the 28th onwards the temperature remained normal and the pulse rate fell rapidly

SUMMARY

1 A case of pneumococcal meningitis is described from which the organism was recovered on four different occasions

2 Complete recovery followed treatment with sulphanilamide

3 A total dosage of 23 grammes was given in thirteen days with two rest periods It is probable that infection was successfully combated by the first course of 10 5 grammes

I am indebted to Mr W Hallchurch F R C S for permission to publish the notes of this case and to Dr S C Dyke F R C P., director of the pathological department of the hospital for much valuable help and advice

Royal Hospital Wolverhampton

Polyneuritis with Oedema simulating Beriberi

Several unusual points occurring in this case make it I think worth putting on record

CASE RECORD

The patient is a girl aged 4 one of four children in a good middle-class family having a normal mixed diet unlikely to cause a vitamin B deficiency Previous medical history includes whooping-cough chicken pox and measles with pneumonia all in the previous twelve months but before September 19 7

Last December she suffered from an acute attack of bronchitis Her temperature varied between 101 and 103 F with a pulse rate of 120 for six days The mucous membrane of her mouth was inflamed but there was no sore throat The quantity of muco purulent expectoration was extraordinary for a child of 4 Occasionally the sputum was blood stained When she had been up two days she complained of pain in her thighs and it was then found that she could not walk properly On examination she was unable to raise her legs from the bed but could move her ankles and toes She could not turn over in bed Knee jerks and ankle reflexes were absent and the plantar reflexes were doubtful extensor Both legs were affected There was a slight evening temperature Her appetite remained good

After a week in bed the use began to return in her legs although she still complained of some pain in them and in her hands. I considered her case to be one of toxic neuritis following the acute pulmonary infection of three weeks before After another week in bed it was noticed that her face was oedematous more so on one side than the other The first thought was of nephritis but the urine contained no blood casts or albumin Injections of adrenaline were tried in case it should prove to be an angioneurotic oedema but without effect The oedema spread to her legs abdomen back and arm It was a hard oedema which pitted slightly after steady pressure There was a morbilliform rash on her hands and face Although her temperature did not rise over 99 F her pulse rate remained above 140 Retino copy showed exudate in both retinae similar to albuminuric retinitis Urine excretion was reduced to about 15 oz in the twenty four hours Rectal feeding had to be carried out for two days as swallowing became difficult No paralysis of the diaphragm was noticed The blood pressure was 90/60 A blood count showed over 5 000 000 red cells per c mm and a leucocytosis of 19 000 with 79 per cent polymorphs Blood cultures were sterile and the blood urea 20 mg per 100 c cm

Parenteral vitamin B_1 (betaxan) 4 mg daily was started on January 29 1938 Four days later the urine excreted was only 11 oz with a measured fluid intake of 20 oz so two small doses of salvrgan were given resulting in a temporary increase of urine to 20 oz in the twelve hours following each injection During these days her evening temperature rose to 102 and her pulse rate to over 150 After eight days of the vitamin treatment there was definite reduction in the oedema in her face and legs Her temperature gradually came down but the pulse rate remained above 150 The vitamin was reduced to 2 mg daily

On the eleventh day the urine excretion suddenly went up to over 30 oz although the intake was still reduced As the pulse rate did not drop in spite of the temperature being normal three daily injections of 10 mg of vitamin B_1 were given This treatment was followed on the day of the third injection by a drop in the pulse rate to an average of 108 She was now able to move her legs and arms but the reflexes were still absent The oedema had gradually got less in the same order as it appeared Unfortunately measurement of the limbs was not thought of until the face and legs appeared normal The forearm then measured 9½ inches Six days later the forearm measured 8¾ inches and one month later—that is two months after the vitamin treatment was begun—only 6¼ inches no trace of the oedema being observed

Recovery was uneventful until March 10 when she contracted a cold from another member of the family She became gravely ill with pyrexia of 103 F pulse rate over 150 and a respiration rate over 50 Again the sputum was excessive There were fine crepitations at both bases and pneumonia was diagnosed On the sixth day she had the crisis with rigors and cyanosis From this time progress has been steady The knee jerks returned and the plantar response became flexor Now six months after the beginning of the illness her pulse rate averages 84 she can walk well and she is putting on weight In all 74 mg of vitamin B were given intramuscularly and since stopping the injections she has had the vitamin by mouth in the form of ryzamin B

COMMENTARY

Apart from beriberi I can find very little in the literature that resembles this case Mackay (1932) describes a case of peripheral neuritis as a complication of angioneurotic oedema while Boyd Campbell and Allison (1932) describe a case of polyneuritis with urticaria Ford (1937) gives an account of acute febrile polyneuritis following acute pulmonary infection which closely resembles this case except that oedema is not mentioned Price (1938) reports a case of alcoholic beriberi with polyneuritis and oedema

In comparing the results of vitamin B_1 treatment in this case with the results in beriberi as described by Strauss (1938) and Hawes Monteiro and Smith (1937) the most marked differences are the delay in the reduction in the pulse rate and the delay in the diuresis These may have been due to inadequate dosage although this compares favourably It is for this reason that I doubt if the present case can be considered to be due to a vitamin deficiency

I wish to thank Dr J V C Braithwaite and Professor L Parsons for their advice and for their interest in this case

Reviews

CELSUS REDIVIVUS

De Medicina By Celsus Volumes II and III With an English Translation by W G Spencer, M S, F R C S The Loeb Classical Library (Pp 649 (both volumes) 10s net each volume (leather 12s 6d net) 2 50 dollars each volume (leather 3 50 dollars)) London W Heinemann, Cambridge, Mass Harvard University Press 1938

Celsus is coming into his own again From 1815 to 1858 he was known and hated by every medical apprentice in England His treatise *De Medicina* was used by the Society of Apothecaries to test the knowledge of Latin in the examination for the L S A The examiners on the Court—like the Wheelers and the Rivingtons—were scholars, and little mercy was shown to the more ignorant candidates Various translations came into use, the best known being that by Dr G F Collier of the Academy of Leyden and of Magdalen Hall, Oxford These English versions, however, were of the nature of "cribs," designed to facilitate the passing of an ill-educated boy They are now finally superseded by the scholarly translation made by Mr W G Spencer, consulting surgeon to Westminster Hospital, and published in the Loeb Classical Series The Latin and English are printed on opposite pages, and it is thus easy to compare the translation with the original Mr Spencer has been successful, his version is crisp, accurate, idiomatic, and being himself a surgeon he has been able to elucidate various technical points The two volumes recently published complete the work They deal with Books V to VIII—that is to say, with drugs, external and internal remedies, and what may be called folk medicine Books VII and VIII treat of surgery, and tell of the operations in more common use in Rome in the first century of the Christian era, and of the treatment of fractures and dislocations Read with intelligence and with a recognition of the limits of the time it shows that classical surgeons knew and ventured much more than they are usually given credit for In his second volume Mr Spencer gives a list of the remedies used by his author, and of the drugs, herbs, and other ingredients of his prescriptions—not a mere list but an account of each In the third volume there is an appendix on the meaning of the word "cancer" in Celsus and his reference to malignant disease, a list of parallel passages in Hippocrates and Celsus, and a satisfactory index to the three volumes

Mr Spencer is to be congratulated very heartily on having brought several years of work to so successful an issue It shows that in England the cultured surgeon is no more dead than the learned physician

ORGANIC CHEMISTRY

Principles of Organic Chemistry By H P Starck, M A Cantab (Pp 664 58 figures 7 tables 12s 6d net) London and Glasgow Blackie and Son 1938

Starck's *Principles of Organic Chemistry* is well designed for the requirements of a beginner in the study of the subject In his preface the author remarks that the difficulty of mastering the first principles is increased by the introduction of complex compounds at an early stage before their methods of preparation and characteristic properties have been described This is a fact of outstanding importance and is one that has received scant recognition by writers of textbooks on organic chemistry Starck has followed the aim which he has set up and has produced a book in which the principles are taught by reference to compounds of the simplest constitution He has recognized further that the best foundation for a knowledge of principles is only to be obtained by practice in the methods of production of compounds, for only by this means can the properties of the compounds be realistically revealed He has accordingly included exercises in practical work which are suitably chosen and described in sufficient detail to enable the student to accomplish them successfully And further to enliven the student's interest, and to induce him to exercise constructive thought, he has appended to each chapter a series of questions, the answers to which will call for attentive consideration of what he has read Nothing seems to be omitted from the book that is required to give the student a comprehensive grasp of the subject It also includes important matters of a novel character, such as a description of the Svedberg ultracentrifuge, which by its high speed of 65,000 revolutions per minute has been used successfully to sort out particles of almost molecular magnitude

NECROPSY ON A GORILLA

Bericht uber das Ergebnis der Obduktion des Gorilla Bobby des Zoologischen Gartens zu Berlin By Dr Walter Koch (Pp 36, 17 figures RM 2 50) Jena Gustav Fischer 1937

Dr Walter Koch's report on the post-mortem findings of the gorilla "Bobby" of the Zoological Gardens of Berlin consists of two parts The first is a very careful and thorough report on the necropsy of the ape, including exact measurements of different parts of the body as well as the weight and size of all important internal organs The second part deals with the problem of the actual cause of death of this remarkable animal, which reached in ten and a half years a weight of 266 kg (=585 lb, or approximately 42 stone) and a height of about 5 ft 8 in

Necropsy revealed an appendicitis, oedema of the lungs calcification of renal epithelia, and extreme obesity At first it was impossible to decide which of these findings was responsible for the death Numerous bacteriological tests were carried out with material taken from the nasal cavities, pharynx, tonsils, trachea, bronchi, lungs, spleen and various parts of the intestinal tract, but the result was practically negative The lungs showed slight adhesions on the right upper lobe There was no fluid in the pleural cavity Most of the tissue of the lungs, especially the upper lobes, was full of air but oedematous Apart from the oedema, the blood in the arteries and veins of the lungs contained a very great amount of leucocytes and agglomerations of leucocytes in thrombi An actual lobar pneumonia, however, did not exist, but some early foci of consolidation were found No pathogenic bacteria or cocci were found, but putrefactive germs were numerous The author therefore comes to the conclusion that the condition of the lungs is to be interpreted as a terminal aspiration pneumonia which lasted probably only one or two days

The condition of the appendix was very similar to that in the case of human appendicitis the processus vermiformis was bent and adhered to the peritoneum of the abdominal wall near the spine The peritoneum was here thicker than the normal and covered an abscess of the size of a large bean Inside the abscess was fibrous tissue extending into the submucosa of the appendix, indicating with great probability a previous ulcerating process The kidneys showed slight signs of nephrotic degeneration and the already-mentioned calcification of renal tubuli The

examination of the kidneys with regard to metallic poison (corrosive sublimate) was negative

The testicles which had a weight of only 10·5 grammes (=about 1/3 oz) were distinctly hypoplastic There was no spermatogenesis In connexion with the fact that the epiphyses were not completely ossified and that the hypophysis showed no intermediate lobe but a persisting cystic cavity separating the neuro and adeno hypophysis Dr Koch circumstantially discusses the problem whether the hypoplasia of the testes etc was primary or conditional upon the alleged delayed development of the hypophysis

DEFENCE OF THE EGO

The Ego and the Mechanisms of Defence By Anna Freud Translated from the German by Cecil Baines The International Psycho Analytical Library Edited by Ernest Jones M D (Pp 196 9 net) London Hogarth Press 1937

There can be no question but that psycho analysis is becoming more intelligible to the ordinary reader Whether this is because the ordinary reader is becoming better educated in respect to psycho analytic thought or because psycho analysis is becoming less esoteric it is difficult to say In any case the present volume will repay the study of a large public who owe no allegiance to the psycho analytic school

The ego has got to defend itself against the id—that is the instinctual drives which demand direct and perhaps crude and conflicting expression Protection may be needed because these instincts are inconvenient or because they are too strong and threaten to overwhelm the ego altogether Or the defence may be required against the outside world though this may in the last analysis be the same as the first since these outside objects serve as stimuli to the instincts which are within the personality Thirdly defence may be needed against the tyranny of the superego—the system of laws and ideals established within the personality largely as a result of the dictates and examples of the child's parents and elders In the present volume the mechanisms of such defence are admirably described with illuminating clinical examples Still however the pansexualism is apt to strike a jarring note One wonders how the headmistress of a girls' school devoted to athletics would receive the statement that a girl set herself to excel in drill and gymnastics as a substitute for the acrobatics of her brother's genitals It may be said that if she was thoroughly up to date the headmistress would accept this as a simple statement of fact but the reviewer would regard the outraged susceptibilities of the old fashioned mistress with a certain degree of sympathy

DIET AND BLOOD PRESSURE

High Blood Pressure By I Harris M D in collaboration with C N Aldred M D J T Ireland B Sc and G V James M Sc (Pp 132 22 figures 10 6d net) London Humphrey Milford Oxford University Press 1937

In this monograph Dr I Harris describes his researches into the causation of hypertension These have been concerned with bodily metabolism and relate largely to the changes found in the blood and urine in high blood pressure The first chapter reviews the results of experiments designed to correlate blood pressure with the intake of protein in the diet Non protein nitrogen and urea values in the blood under high and low protein diets are considered in the second chapter while the third deals with the corresponding urinary variations Further sections are devoted to analyses of metabolic exchanges and discussions of the results of these biochemical studies Dr Harris infers from them that the lower the protein intake the lower the arterial pressure and that it is the quantity and not the nature of the protein that matters On a fixed protein intake he has found that the elimination of nitrogenous end products of metabolism takes place more quickly when the blood pressure is higher Further in hypertension the non protein nitrogen was found to be within normal limits except in very advanced cases while urea clearance was retarded A diet rich in protein was observed not only to increase the blood pressure but also to augment the calcium and potassium content of the blood

These and many other observations in this work are of considerable interest and they demonstrate the important part played by diet and particularly protein foods in the bodily metabolism and in influencing blood pressure No one would dispute that there must be other contributory causes of high blood pressure since many people who take a high protein diet preserve normal blood pressures, while vegetarians are not immune from hypertension In this as in other departments of medicine a broad view must be taken when pathogenesis is under consideration As for hypertension familial taint and endocrine imbalance are undoubtedly important in addition to diet while it is difficult not to suspect that some disturbance of the renal function underlies even so called essential hypertension Dr Harris's book deserves the attention of all who are interested in the problem of high blood pressure

GASTRO-INTESTINAL PAIN

Digestive Tract Pain Diagnosis and Treatment Experimental Observations By Chester M Jones M D (Pp 152 5 figures 10 6d net) New York and London The Macmillan Company 1938

Dr Chester Jones has investigated digestive tract pain both experimentally and clinically he has confirmed some old observations and made some new ones which are both interesting and important He recalls the original work of Ross (1887) which suggested that unexplained sensations from a diseased viscus would be perceived by the individual as cutaneous or subcutaneous sensations These observations laid the foundation for the modern conception of referred pain but in addition he recognized the existence of deep visceral pain Sir James Mackenzie and Sir Henry Head (1893) subsequently elaborated these views (though we think Dr Chester Jones does rather scant justice to the latter's contribution) but while both believed that the sympathetic did not carry painful sensations Head did not deny the existence of direct visceral sensation The author quotes with approval J C White's views (1935) that the large medullated fibres scantily present in the sympathetic did unlike the non medullated ones convey sensation but surely this had already been advocated more than forty years ago by Edgeworth working under Gaskell's direction and was accepted as a satisfactory reconciliation of the discrepant views The matter took a fresh turn when Sir Arthur Hurst (1911) explained that the observations on the comparative insensibility of visceral structures were due to the application of an inappropriate stimulus For tubes containing plain muscle he maintained the effective stimulus was tension Thus the riddle was resolved of the causation of agonizing pain in structures that could hardly appreciate the clean cut of a scalpel In the research before us the balloon method of expanding different portions of the alimentary tract was employed and not only was Hurst's explanation confirmed but extensive studies in localization were carried out, and it was found that

subjective localization of the pain was most accurate where the structure involved was most fixed—for example, in the intestine over the appendix or at the hepatic and splenic flexures A very interesting study of the sensation of heartburn" showed that it depended almost entirely on the degree of tension developed in the oesophagus and not on the acidity or temperature of its contents

Head regarded the cutaneous pain or hyperaesthesia referred from a visceral lesion as due to the ordinary stream of sensations from the skin falling into a segment of the spinal cord already irritated through its splanchnic supply Dr Chester Jones has confirmed this in an ingenious way He injected novocain into the skin area and found that this abolished the superficial pain while leaving the deeper pain unaltered His study of gastro-intestinal pain in "functional disease" is of much interest Every clinician knows that such pain may apparently be as great as in any organic disease and, indeed, that serious organic disease may evoke singularly little pain It is all a question of the 'effective stimulus' a loss of balance between the sympathetic and parasympathetic is capable of causing tensions which excite severe pain and which are demonstrable by x rays Dr F C Eve has written convincingly of such functional conditions under the engaging title of 'the blunders of plain muscle," though we might suggest that if 'someone had blundered' it was the autonomic nervous system and not the unfortunate and suffering muscle!

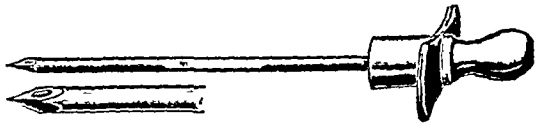
No one can read this stimulating book without gaining a fresher and more intelligent appreciation of a subject of real practical importance

Notes on Books

The second series of signed articles on the Management of Some Major Medical Disorders, which had appeared week by week in these columns in 1935–6, were republished in book form by Messrs H K Lewis and Co as Volume II of *Treatment in General Practice* The fifty chapters were grouped under diseases of the nervous system, diseases of the digestive system, diseases of the blood and blood-forming organs, rheumatic diseases, metabolic diseases, and diseases of the kidney A second edition has now been called for and is published at the same price (10s 6d), each chapter having been submitted to its author for revision, except that by the late Dr Kinnier Wilson, which is revised by Dr Macdonald Critchley The new edition of Volume I of *Treatment in General Practice* (H K Lewis and Co, 8s 6d) was announced in our issue of July 16

No great prescience is required to realize that the future progress of bacteriology lies mainly on biochemical lines Students of the science are bound to see more and more biochemistry introduced into their subject and they will therefore find it a boon to have available the assistance of Dr C G ANDERSON'S excellent little textbook, *An Introduction to Bacteriological Chemistry* obviously the work of an able teacher The specialized biochemistry of bacteria, yeasts, and moulds, comprising their nutritional requirements, metabolism, and by-products, is arranged to follow introductory chapters on underlying physico-chemical conceptions such as *p*H, oxidation-reduction potentials and the like Detailed attention is paid to alcoholic fermentation and to the basis of other industrial processes for which micro-organisms are used The author has a keen eye for the recognition of what is important in the applied sense as well as in the academic and never fails to add where possible a point of special practical importance He concludes with a review of the fundamentals of immunological chemistry, rendered with that same clarity which is manifest throughout the previous sections The volume constitutes an excellent introduction to the larger works on the subject, such as that of Buchanan and Fulmer It is published by E and S Livingstone of Edinburgh at 10s 6d (postage 6d)

The second volume of the first series of the *New International Clinic* (J B Lippincott Company, four vols 50s) contains fifteen original articles, including papers on epidemic encephalitis, heart surgery, brucellosis in Pennsylvania, tuberculosis of the prostate, lymphogranuloma venereum, and a new treatment for acute infections (anthinco therapy), six clinical lectures devoted respectively to anaemias, cortical adrenal tumours, Bright's disease, bilateral renal carbuncles, spontaneous hypoglycaemia, and surgical cases, and a review of regional ileitis



Preparations and Appliances

A SIMPLE ARTIFICIAL PNEUMOTHORAX INDUCTION NEEDLE

Dr F G CHANDLER F R C P, senior physician to the London Chest Hospital and physician to St Bartholomew's Hospital writes

In 1925 I described[1] an improved artificial pneumothorax refill needle with a trocar end which was made according to my instructions by Messrs Allen and Hanburys This was subsequently modified by Dr Andrew Morland, who had a slit made instead of a round aperture at the side of the needle This had the advantage of allowing air to pass more quickly and a freer oscillation in the manometer, with an even smaller diameter needle These advantages are often nullified however by the slit filling with blood which practically never happens with the original needle with the small round hole at the side The use of this type of needle is limited to cases *where a definite pneumothorax exists*

Later I asked the Genito Urinary Company to make a needle with the hole in one of the facets of the trocar, as illustrated the idea being that immediately the point of the trocar was

through the parietal pleura the opening of the needle would be there also A swing of the manometer would occur and the admission of air could be allowed straight away

For about ten years I have tested this needle and am convinced of its value It can make the induction of a pneumothorax in many cases as easy as a refill The lumen may be blocked with blood and this is the reason why it is not successful in all cases To take the needle out, wash it through and dry it may seem to take too much time (though in reality it takes only a few moments) it is desirable therefore to have one or two spare needles in reserve If the method fails other types of refill needle may be employed I used to call it the lucky dip method but now I am convinced that it is far more than a lucky dip'

There is hardly need to describe the technique, it is so absolutely simple After anaesthetizing the skin and the parietal pleura—noting the distance of the parietal pleura from the skin by passing the needle slowly and gently through the insensitive intercostal muscle until the patient just begins to feel the needle—the induction needle described is pushed gently through this anaesthetized track until oscillation occurs in the manometer There is no need for any of the numerous manipulations that are so frequently demanded by the trocar and cannula type of induction needle

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY AUGUST 6 1938

ARE PELVIC MEASUREMENTS WORTH TAKING?

The dimensions of the pelvis and the means of their determination have for generations been regarded as the fundamentals of obstetric knowledge It is therefore remarkable that simultaneously with the development of precise methods of mensuration many obstetricians are now to be found who ignore the inch rule and insist that the intelligent use of the fingers in palpation and the exercise of the clinical sense' are the only safe guides in foretelling the outcome of labour One evidence of this tendency is the increasing use now made of 'trial labour' in the treatment of supposed disproportion between foetus and pelvis Premature induction of labour in the primigravid woman for contracted pelvis has been completely abandoned in many clinics patients with grave pelvic contraction are treated by Caesarean section while those showing minor degrees of pelvic contraction are allowed to go into spontaneous labour and only if evidence accumulates that the natural forces are unable to overcome obstruction is a lower-segment Caesarean section undertaken There is a twofold advantage in this policy on the one hand numerous inductions of labour are avoided with consequent improvement in sepsis and infant mortality rates and on the other hand the Caesarean operation itself is more rarely performed because the forces of labour so often prove successful in overcoming supposed pelvic obstruction There is however another side to this question It is sometimes very difficult to say whether a foetal head which is still barely engaged in the pelvic brim after several hours of "trial of labour" will in fact pass through the remainder of the pelvis —and pass in undamaged condition Great responsibility is thus thrown on the medical attendant and there is an unfortunate tendency for the important decision to be postponed from hour to hour with the result that Caesarean section should this finally become necessary, is a more dangerous operation than it would have been if performed at the time of election The humanitarian aspects also demand attention It is no triumph of medical art to subject a woman to a prolonged test of physical and mental endurance in order that it may be proved to her beyond any doubt that her pelvis can or cannot accommodate a foetus of such and such a size

This subject has been vigorously discussed of late in the pages of the *Lancet* Its wider aspects need not concern us here but the fact that such discussion can now take place is a clear proof of a change of heart in obstetricians Gone are the days in which the treatment of contracted pelvis was governed by rigid rules concerning the indications for Caesarean section and the induction of premature labour There is no doubt that the present position has been reached because of the comparative failure of clinical measurements of the pelvis as hitherto obtained to provide a means of foretelling the ease or difficulty of the pending labour More and more the truth of Barbour's dictum is being recognized— The foetal head is the best pelvimeter This is to the good but the pelvimeter whether it be the callipers or the foetal head itself cannot indicate the manner in which the presenting part will engage nor forecast the frequency and strength of uterine contractions Least of all can it measure the patient's mental make up the colonel's lady and Judy O Grady' may be sisters under the skin but this family resemblance has a tendency to fade as the hands of the labour ward clock make their slow repeated round Here then are reasons for the distrust of precise measurements and the reliance on 'clinical sense' But sound judgment is given to few and only as the reward of many years of patient observation The experienced obstetrician may instinctively recognize the feel of a disproportionately small pelvis and be able to sense the difficulty which is likely to ensue but the younger worker must perforce seek more tangible evidence of pelvic and foetal abnormality in order that he may deal intelligently with his patient On both scientific and practical grounds there is we believe good reason to continue to employ the more reliable of the methods of pelvimetry and cephalometry

External pelvimetry has its uses in showing certain deviations from the normal type of pelvis but as a means of accurately determining the internal diameters it has long been discredited Serious contraction of the true conjugate may be present with a normal external measurement of Baudelocque and conversely small external measurements are no certain indication of a corresponding diminution of pelvic capacity Internal palpation of the pelvis is of great value and the determination of the diagonal conjugate (from which the true conjugate may be estimated) is generally regarded as the most useful single pelvic measurement which can be taken at the patient's bedside But even this long-established obstetrical

procedure has not escaped criticism Mr J Howkins[1] has declared that it is only in cases of extreme rarity that the promontory of the sacrum can be reached by the examining finger and he describes many errors which the inexperienced worker may make His conclusion that "the clinical measurement of the true conjugate is either impossible in practice or is inaccurate when measured, in all but cases of severe pelvic contraction, and a genuine attempt to measure it demands in the primipara a full anaesthetic" may be surprising, but it is also perhaps significant that no reader has yet replied to this challenging statement No doubt the ease with which the promontory is reached depends to a large extent on the length of the obstetrician's fingers, but equally important is the method of examination, for it is certain that unless the perineum is well depressed by the knuckles the tip of the middle finger will seldom reach the promontory Moreover, adequate pelvic examination is not possible till the later weeks of pregnancy for only then does the vagina become sufficiently soft and elastic to yield to the examining finger The statement that a promontory which is easily palpated is an indication of a contracted pelvis will meet with general approval, but the implication that measurement of the diagonal conjugate is in general beset with so many difficulties that the attempt to take it need scarcely be made may well form a topic for further discussion

In our present issue there appears at page 284 a paper on the merits of x-ray pelvimetry by Dr A Orley There is no question that several of the modern methods of radiological examination of the pelvis give exceedingly accurate information and for some of them it is claimed that the diameters of the brim can be estimated to within 0 2 cm of the true measurement Dr Orley's method is to superimpose the shadow of a lead plate perforated at 1-cm intervals on to the shadow of the patient's pelvis It is a modification of the methods used by Jarcho and Thoms in America and by Roberts and Rowden in this country it has the merit of simplicity and does not require elaborate apparatus Measurement of the foetal head is not discussed by Dr Orley but this equally necessary information can be readily obtained by various well-known procedures notably by Reece's technique[2] or by lateral pelvimetry as recently advocated by Thoms[3] Generations of obstetricians have sought a perfect method of pelvic and foetal mensuration, and it is fair to say that radiologists can now make good claim to have answered the call How useful are these new methods? Time alone can tell Meanwhile, thorough and patient trial is necessary Extreme opinions are too often expressed on this subject The statement that every woman who is about to be married ought to have her pelvis radiographed and the measurements engraved on her wedding ring gives as false an impression as does the statement that the proper place for obstetrical callipers is in the medical museum Both opinions stress one aspect only of a very complex problem, and both are equally misleading

QUACK MEDICINES AND OBSCURANTISM

Lord Horder added another to his many services as a public man by his speech in the House of Lords on quack medicines, summarized in last week's issue of the *Journal* and fully reported in our Parliamentary Notes this week The speech was characteristically courageous and outspoken While admitting that some of the profusely advertised preparations are useful, and the claims made for some reasonable, when he went on to say that most did little good or harm but were sold at fantastic prices and some were fraudulent Lord Horder said what is known to every student of the problem The most telling part of his speech was devoted to the incongruous position of a Government which makes no effort to regulate this traffic while spending money and energy in advocating greater national fitness The Government spokesman, Lord Gage, was obviously uncomfortable when he replied, as he might well be There was the usual admission of many of the evils of the traffic, with the usual suggestion that the Government was helpless Lord Gage threw the main blame on the individuals who were so foolish as to be gulled by quack advertisements This really will not do in face of the vast amount of legislation designed to protect the ignorant and unwary against those who prey on them Of course Lord Gage promised to consider any suggestions made for dealing with the problem, and hinted that Lord Horder might try his hand at a Bill We should doubt if Lord Horder will be tempted to take all the trouble involved in such a step when he recollects the fate of the very modest Bill debated in the House of Commons on March 27, 1936,[1] and talked out with no protest on behalf of the Government With all the evidence in the possession of the Ministry of Health, including the damnatory report of the Select Committee of 1914 together with Lord Horder's recent figures and the able summary of the present position

[1] See *British Medical Journal* April 4 1936 p 7-6

Professor A J Clark's little book[1] the Ministry cannot escape this dilemma It must either proceed to action with full Government support or continue to labour under the suspicion that it is afraid of the enormous vested interests concerned in this traffic

In his Conway Memorial Lecture three months ago Lord Horder discussed obscurantism in some of its many forms[2] He noted that in matters of health and disease the influence of obscurantism has been and still is marked We have only quite recently become interested in health as distinct from disease Tracing the emergence of organized medicine of to-day from the trammels of magic and theology he showed how man the sufferer lags far behind medicine and its exponent the doctor The mysterious which is the obscurant often makes a greater appeal than does the plain statement of how the high road of physiological rectitude has been departed from and how to regain it What is the secret of the quack's success? In reply to this question Lord Horder said that the argument such as it is runs thus in the mind of the patient He is not trained and he is not recognized by law how clever he must be by nature therefore to be able to cure people! His power is a direct and supernatural gift a power which on that account must clearly be superior to even the highest skill which comes from a long and painstaking study on the part of the registered practitioner The same holds good of the quack's indirect appeal to credulity through the artifices of advertisement experts in frightening and persuading the public by means of the printed word An obscurant according to the dictionary is one who opposes inquiry enlightenment and reform The Ministry of Health cannot be charged with opposing inquiry and enlightenment But will it passively obstruct reform of the law in relation to quack remedies? Or will Dr Walter Elliot summon up courage and with his Department behind him insist on a Government Bill in the near future?

SOCIOLOGICAL ASPECTS OF A DERELICT AREA

An interesting and unusual feature of the Section of Medical Sociology at the Annual Meeting at Plymouth was an exposition by the local schoolmaster of sociological changes in a derelict mining area in Cornwall followed the next day by a visit paid by members of the Section and others to the centre in question The derelict village is St Day in the parish of Gwennap two miles from Redruth with a population of between 1 100 and 1,500 a little pocket of people typical of at least twelve pockets in the old Cornish mining country This was formerly a copper-mining district with an industrial history going back into the Middle Ages Its greatest prosperity was during the first half of the last century In 1801 the population of the district was 4 000 by 1841 it had become 11 000 now it is back at 4 000 again The mining industry came to an end with the closing of the last mine which had employed 3 000 persons in 1870 The effects of the ensuing depression however were not felt immediately because successive emigrations from the parish took place the emigrations of course taking away the more adventurous independent and fearless of the stock Therefore although the industrial disaster occurred finally in 1870 these emigrations and later the demand for war service masked the decay and the full harvest of poverty has not been reaped until the third generation

The schoolmaster Mr R R Blewett gave a vivid picture of a community where water is still carried through the streets and sold from a cart where street lighting was unknown until four years ago where over 30 per cent of the insured workers are unemployed where fewer than ten houses have been built in the last fifty years where free milk is given to more than one half of the school children (as compared with a quarter of the school children in Merthyr Tydfil) where more than half the 268 men employed work in surrounding towns and villages travelling 370 000 workers miles in the year and where the Methodist chapels with their accommodation for many hundreds speak of a flourishing past and with their handful of members of a very thin present Mr Blewett mentioned that in 1927 the school medical inspector reported the presence in St Day of an unusual number of subnormals In the boys' school there were found seventeen serious cases and twenty cases less serious the former showing a retardation of from four to seven years and the latter a retardation of from two to four years Of the total of 105 children who might be described as educationally defective thirty three lived in a very bad environment thirty nine in a poor environment and twenty seven in an environment which was good Mr Blewett had also endeavoured to study the intelligence and character of the parents of these particular children The parents of 18 per cent of them appeared to be normal not enough was known of 19 per cent to form any judgment and one or both of the parents of 63 per cent appeared deficient or backward In his school 136 families were represented These families included in all 551 children an average of 4 05 per family Twenty one families had seven or more children with a total of 195 and an average of 9 3 per family At the other end of the scale there were forty four families with only one or two children The fathers of fifty three of the families whose members attended his school were unemployed and their children at school numbered 127 He had found no relation between the unemployment of the father and the intelligence or backwardness of the children Some children from the smallest families were the lowest in intelligence Among the bigger families the intelligence level did not appear to be so low As to physical characteristics for what they were worth

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

FRACTURES OF THE SHAFTS OF THE FOREARM BONES

BY

E. W. HEY GROVES, M.S., F.R.C.S.

General Considerations

In no class of fracture is it more important to be able to recognize the distinction between the simple case in which mere reposition and splinting will give a good result and the difficult case in which a special kind of traction must be applied or a well-planned operation performed. This is because the integrity of the forearm bones is essential for the skilled movements of the hand. Recognition of the difficult case requiring special treatment should be made early—that is within a week of the injury—because if once malunion or non-union has taken place it will be a much harder problem to restore the limb to usefulness, and operative treatment will be a much more difficult and uncertain remedy. To re-establish perfect function it is necessary not only to obtain correct length and proper alignment of both bones, but also to restore the outward bowing of the radius. This outward curve of the radius is necessary to enable the bone to be rotated round the ulna in the movements of supination and pronation. The fact that the supination muscles, of which the biceps is of much the most consequence, are all attached to the upper part of the radius makes it important to put up the forearm either in full supination or midway between pronation and supination. This is because the upper part of the radius will always be held in a supinated position by the biceps, and it is therefore necessary to bring the lower part of the bone into the same position of rotation. Throughout the whole stage of fixation the joints proximal and distal to the arm should be immobilized, but the muscle should be regularly and systematically exercised daily. The fingers and thumb must be left free, and also the shoulder. The digits must be exercised by active grasping movements and the shoulder by abduction and rotation.

Careful supervision is necessary during the period of immobilization. While it is true that in easy cases in young patients consolidation may take place within four weeks it often happens that when there has been gross displacement originally and especially in older patients, bony union is slow, and if the retentive cast is left off at the end of a month angulation and pronation may recur. Therefore it is wise to keep some form of retentive splint for a further period. After the first five or six weeks the complete plaster cast may be removed and replaced by a single slab of plaster extending from the palm of the hand up to the level of the deltoid, on the flexor aspect of the limb. This is removed daily for active movements of flexion and extension of the elbow and rotation of the forearm. It will be worn for a further period of about six weeks.

Greenstick Fractures in Children

In these fractures there is angulation of both bones, which are broken at the same level about the mid-point of the shafts, but there is no actual separation of the fragments, which are held together by the envelope of periosteum. Treatment consists in manual straightening of the forearm and in applying two plaster slabs (1) from the knuckles to the mid-point of the upper arm on the extensor aspect, and (2) from the palm of the hand to the mid point of the upper arm on the flexor aspect. The plaster slabs are united by the turns of a roller plaster bandage. The elbow is flexed at a right angle, and the hand is midway between pronation and supination and is slightly dorsiflexed. The fingers and shoulder are exercised daily, and the plaster is removed in one month.

Fracture of Both Shafts without Much Displacement

In the typical case the ulna is broken in its lower third and the radius in its upper third, or if the forearm has been broken by direct violence both fractures are at the same level, about the middle. However obvious the fracture may be, a radiograph should be taken to show the exact relation of the fragments and the existence of any comminution. If for any reason the final manipulation and fixation cannot be done at once, a temporary splint should be applied. This is conveniently made by a piece of Cramer wire splint bent to a right angle and extending from the insertion of the deltoid to the palm of the hand, the elbow being at a right angle and the forearm supinated. Merely hanging the forearm in a sling across the chest is apt to increase the displacement. A general anaesthetic should be given when the fracture is put up. Local anaesthesia is not easy in this fracture because the bones lie deep in the soft parts and the solution will be diffused along the connective tissue planes. The method of reduction and fixation consists in traction on the hand and the application of a plaster cast. It is most useful to have a portable x-ray viewing box, with which it can be seen in what position the bones assume the best line and also whether the upper and lower fragments of the radius are locked sufficiently to move together when the hand is rotated. Counter-traction is made on the bent elbow by one assistant while another pulls on the hand, which is held almost completely supinated. Two slabs of plaster are prepared so as to lie one along the flexor and one along the extensor aspect of the arm and long enough to reach from the palm of the hand or the knuckles to the insertion of the deltoid. These are applied direct to the skin without any padding and then joined together by circular turns of plaster bandages. A gap of about a quarter of an inch should be left between the outer margin of the slabs so as to facilitate the splitting of the cast. For the first twenty-four hours a careful watch should be kept for any evidence of swelling or ischaemia. For this reason the patient ought to remain in hospital or certainly be seen again within twelve hours. Evidence of interference with the circulation will be given by coldness or discoloration of the fingers or by increasing pain. On the first appearance of either of these signs there should be no hesitation in splitting the plaster. After the cast is comfortably settled, the patient should be instructed to carry out regular movements of the fingers and thumb and the shoulder. The cast is removed at the end of six weeks or rather less if the position is good.

Typical Mid-shaft Fractures with Gross Displacement

These are fractures which may exercise the patience and resource of the surgeon to the utmost The traction needed for reduction will have to be much more powerful and be sustained for a longer time than in the first type considered and it may have to be supplemented by some other form of corrective force to keep the two bones from sagging together Patience and perseverance are more essential to success than any feat of legerdemain The portable x-ray viewing box will be of the greatest use Traction may be applied in various ways but it is essential that it should be maintained for a considerable period not only in order to overcome the muscular resistance but also to keep the arm in good position while the plaster is being applied and is setting The lower part of the arm above the elbow is protected by a surrounding cuff of adhesive felt four inches wide A long strip of four inch webbing is passed round the felt cuff and the two ends are fixed to a staple in the wall or to the post at the head of the bed A wooden spreader is placed between the two limbs of this band so as to leave

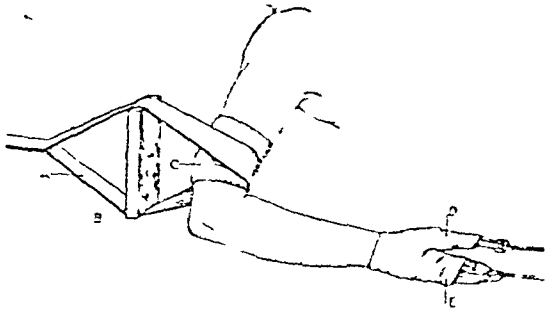

FIG 1—Traction applied to forearm before applying the plaster cast A = Webbing band surrounding the arm above the elbow and attached to a fixed point B = Wooden spreader to keep the back of the arm free C = Adhesive felt cuff round the arm D = Traction band attached to thumb and index finger E = Traction band attached to the three inner fingers

the back of the arm free this provides for fixed counter-traction Traction on the hand should be arranged by applying strips of adhesive plaster along the back and front of the hand and digits one strip doubled over U fashion taking the thumb and index finger and another strip taking the other three fingers These strips extend about one inch above the wrist and are fixed by circular turns of adhesive plaster The ends of the longitudinal strips form projecting loops beyond the fingertips each loop affords an efficient form of traction and moreover the amount of traction on the radius and the ulna can be controlled by having separate traction bands on the outer and inner parts of the forearm Now that both traction and counter traction are provided for it only remains to apply these forces Either immediate traction may be made under an anaesthetic or continuous traction may be applied through the attachment of weights When the fluorescent screen shows that the full length and proper position have been obtained the traction bands on the fingers are tied by cords in the loops to a post at the bottom of the operation table and the arm and forearm are encased in plaster If continuous traction is used the patient is kept in bed with the arm abducted at the shoulder and the elbow bent to a right angle Traction is made on the forearm by weights and cords running over pulleys At least 10 lb will be necessary in the case of an adult—about 6 lb on the radial and 4 lb on the ulnar side of the arm

This continuous traction is kept up for about twenty four hours after which the plaster is applied When this is in position the wrist must be kept in some dorsiflexion and the back of the hand is protected from pressure by a pad of adhesive felt The whole plaster cast is applied before the traction or counter traction is removed This removal is effected by cutting off the webbing above the elbow and the adhesive plaster from the fingers If there is a decided tendency for two bones to sag towards one another this may sometimes be corrected by pressure between the middle of the shafts of the bones The effectiveness of this can be observed by means of the fluorescent screen using at first the tips of the fingers and thumb to produce the separation of the bone and then after the plaster slabs have been applied placing longitudinal wooden rods about four inches in length and one third of an inch wide along the long axis of the plaster back and front pressing them in and fixing them by circular turns of a plaster bandage (Bohler)

If the forearm has been pulled out for the full length and the hand kept in almost full supination with dorsiflexion of the wrist a very useful limb will probably result even though the radiographs show some irregularity at the site of fracture It may happen however that secondary displacement occurs a few days after the

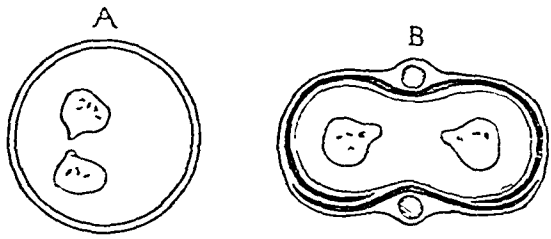

FIG 2—A Diagrammatic section of forearm surrounded by a constricting bandage which has pressed the two bones together B Forearm fracture with plaster slab on flexor and extensor aspects the bones have been separated from one another and this position maintained by placing two wooden rods front and back in the groove between the bones and fixing these by the turns of a bandage

fracture has been put up This is due to shrinkage of the limb allowing of retraction within the plaster Under these circumstances the plaster case has to be removed and traction reapplied two stout Kirschner's wires must then be used to transfix two points (1) the ulna just below the olecranon and (2) the lower ends of the radius and ulna The plaster case is now reapplied incorporating the transfixion wires which are then cut short

I have thought it well to indicate the possibilities of efficient treatment of difficult cases without operation but I think it should be strongly urged that cases be sent to a fracture clinic of repute if they should prove refractory In these cases timely open operation by an expert is often the simplest and best solution of the difficulty if it be done at an early date Sometimes it is only necessary to make a simple exposure of the bone ends when they can be accurately interlocked otherwise plating wiring or pegging will be satisfactory when done by an expert

Fracture of Shaft of Ulna Only

As a rule this causes no difficulty as the displacement is so slight It should be treated by traction and the application of a plaster cast the forearm being put up in a position of mid rotation But if it is complicated by a simultaneous dislocation of the head of the radius at the elbow the matter is entirely different This fracture

dislocation requires to be treated on the same lines as the fracture of both bones with displacement—that is, by a special form of traction with double transfixion I am very doubtful whether it is ever justifiable to allow such a case to be treated by closed methods, especially if the patient is a skilled manual worker The ideal method, in my opinion, is first to reduce the fracture and dislocation by traction and then to operate, uniting the ulna by a plate or wire, and following on by exposing the head of the radius and repairing the torn orbicular ligament If conservative methods are used it is important to check the position by weekly *x*-ray examination, because of the great liability to secondary displacement

Fractures of the Radial Shaft Alone

In many cases these present no special difficulty and the arm should be put up in a plaster case following traction But three special conditions require careful consideration They are

(*a*) *Fractures Above the Middle of the Shaft*—These must be put up in full supination, because the upper fragment will be supinated by the biceps and the lower fragment must therefore also be supinated to be in correct rotary orientation

(*b*) *Fractures at the mid-shaft* are very liable to non-union because the tendon of the pronator radii teres slips between the fragments If, therefore, after apparent reduction and splinting the radiograph (in two planes) shows there is a persistent gap between the ends of the radius the case ought to be submitted to an open operation before bone sclerosis takes place

(*c*) *In fractures at the junction of the middle and lower thirds* there is a great tendency for the lower fragment to be pulled over towards the ulna by the action of the pronator quadratus and the thumb muscles An attempt may be made to correct the displacement by pulling on the thumb and forefinger and by lateral deviation of the wrist towards the ulnar side But if this does not succeed it is far better to operate without undue delay At an early stage, open reduction and fixation by a peg, plate, or wire is very simple and satisfactory

Open Fractures of the Forearm

In cases where there is only a slight wound this should be immediately excised and sutured and the fracture treated as above described In cases of severe crushing, such as when the arm has been caught in machinery, immediate and efficient treatment will be required if the limb is to be saved If it is practicable to transport the patient to a reliable fracture clinic within a few hours this should be done The only circumstance which demands immediate treatment is haemorrhage, but this is unusual in the ordinary type of machinery accident Bleeding must be stopped and 500 units of anti-tetanic serum injected and the decision then made as to whether the case is to be treated on the spot or be sent elsewhere If the latter is impossible the wound toilet must be made It is unnecessary to give details of this The essentials are the toilet should be performed within six hours of the injury, all contaminated surfaces, including an eighth of an inch of the skin edges and all dirt and foreign bodies should be removed swabbing over the surface with 1 in 1,000 flavine solution and immediate suture of the skin edges with interrupted stitches of silkworm-gut The arm is placed in a plaster cast after as accurate a reposition of the fractures as is possible, and windows are cut in the plaster over the wound

The most important consideration is the indication for amputation In general terms, no arm, hand, or finger should be amputated if the circulation is sufficient to maintain life Only if the main vessel has been divided and the distal part of the limb is cold and pulseless should immediate amputation be done The occurrence of gas gangrene, indicated by swelling, crepitation, and a characteristic odour, may require amputation one or two days after the accident

PSYCHOTHERAPY CONGRESS AT OXFORD

The tenth International Medical Congress for Psychotherapy was held at Oxford from July 29 to August 2 On the first evening H M Government held a reception of delegates in Christ Church Hall, with Mr Robert Bernays, M P, as host The congress sessions were held in the Taylorian Institution

Presidential Address

Professor C G JUNG, the President, opened the proceedings on July 30 with an address in which he explained the "fourteen points" of agreement between the various conflicting schools which had been reached by the efforts of the Swiss branch of the congress The motive behind this enterprise was, he said, to lay a basis for practical work and to abandon futile discussion of theory The points were first, that psychotherapy used medical technique for diagnosis it used a relation by the patient of his difficulties, together with a study of his symptoms Forms of illness were observed which had nothing to do with bodily disturbances, but were only intelligible in terms of the psyche This method of diagnosis therefore focused on the general psychic disposition of the patient It considered all possible means of expression associations, fantasies, dreams, symptoms and demeanour It found an aetiology reaching down into the depths of the personality below the conscious mind Investigation led first to the discovery of unconscious fixations on situations and persons significant in the patient's childhood These fixations had both a causal and a purposive aspect and set tasks for future fulfilment One of the tasks of psychotherapy was to illuminate the factors out of which the illness developed and continued, and its method was the analysis and interpretation of all forms of expression The therapeutic development of the patient depended on his relationship with the physician, and this was the basis of his relationship with society It took the form of a transference neurosis—the projection of unconscious contents This neurosis was laid down in the unconscious fixations of childhood, behind which collective unconscious fixations were assumed The new contents must be realized as parts of the personality because only so could the patient feel his responsibility towards them

Psychological Mechanisms in Childhood

Dr A GROENEVELD (Amsterdam), in a paper on early childhood and some of its mechanisms, pointed out the two extremes in the psychic reality of the child an appreciation of concrete realities and a tendency towards unbounded and diffuse fantasy The child showed too easy acceptance of empiric reality, magic reactions such as premature deification of banal facts, and a tendency to homogenize a world of conflicts and thus to escape from unbearable reality He searched for increase of potentiality in excitement and explosive relief He was inclined to catastrophe and sudden transition he was handicapped by canons such as the craving for symmetry, perfection, and constancy The formulae of homogeneity and canonotropism might be valuable in the understanding of adult neurosis

Dr F KUNKEL (Germany) introduced the basic concept of "We" as a suggested solution of educational difficulties The child was born into a 'We' conditioned environment in which he could not distinguish himself from the mother but every unfavourable experience of adult behaviour broke

this original We state The psychotherapist should therefore adopt a We -centred attitude and draw the child into it educating him in the same attitude and then through him modifying the egocentric attitude of the mother The new attitude of the child to the group he called the maturing We which included and accepted differences in its members

Dr H NEUCARTEN (Germany) considered that this concept could not offer a complete solution unless it gave full weight to the development of the individual and allowed him to realize his essential difference from the We In the last resort the concept broke down when the group met another with which it could not be reconciled Dr J H VAN DER HOOP (Holland) feared that the idea might make psychotherapy seem over simple and avoid the distinct problems presented by the many Wes —sexual social and spiritual

Play Therapy

Dr MARGARET LOWENFELD dealing with the theory and use of play in the psychotherapy of childhood said that the child's mind contained at first a totality of mechanisms which could not be analysed a primary system and that this must be expressed by any non verbal means which proved suitable It was *incommunicable in a codified* set of symbols His secondary cognitive system grew up alongside it and could express itself to others. The primary system had a structure but it was different from that of the cognitive It contained a mass of combined material combined rationally but according to the bodily experience of the combiner If the child be given play material which would enable him to externalize his primary system and then incorporate it again into himself he would get well and pass on to a proper centre of gravity in his secondary system

Dr C BOENHEIM who also spoke on the scope of child psychotherapy said that therapy depended on the exact analysis of structure The changes resulting from development demanded reserve in considering the treatment and confidence in the curative powers of nature Many nervous disorders were connected with physiological development—for example anorexia and enuresis—or associated with disorders of mental development which should be treated by educational methods Suggestibility and plasticity *should be used consciously instead* of unconsciously The child depended on his environment and so his surroundings must be investigated and modified if necessary The parents might have to be treated Approaches varied the object being to make unconscious contents conscious Play therapy word therapy drawing and dream interpretation had useful application

Dr C L C BURNS (Birmingham) *spoke of the value of* play therapy as a communication between unconscious and conscious the children spoke in the old language of fable parable and dream Dr W FÜRSTENHEIM (Frankfort) said that it was often difficult to distinguish between neurotic and neglected children Long patience with play methods would usually be rewarded

The Development of Personalities

Dr J H VAN DER HOOP gave an address on analytic and synthetic processes in the different phases of life He said that in the phases of stability analysis was called for but in a phase of flexibility a synthetic technique was necessary to complete the work as for example with childish patients and those with a psychopathic personality or genius Special forms of synthesis and equilibrium were propagated by ideals Spiritual ideals expressed the total meaning of life Objectivity in treating synthetic problems of puberty or a crisis involving spiritual ideals meant an ability to see the value of different social forms and of different solutions of major problems The creation of a synthetic psychology describing the meaning of different ideal values was necessary for treating problems involving the formation of new ideals

Professor H C RÜMKE (Holland) expressed a caution against analysis with a view to partial disintegration even for patients in a well integrated phase In the latent period of middle life case was particularly necessary to ascertain whether the symptoms were those of neurosis or negation for analysis of the latter might be harmful Dr H SCHULTZ HENCKE (*Germany*) *pleaded for the retention* of the term analysis for real dissection of psychic contents which formed only a small part of practical psychotherapy It was indiscriminately applied also to the act of drawing the patient's attention to the significance of his material and pointing out faults of attitude—both essentially synthetic processes It was an ancillary process—a medium between science and synthesis Dr IRA WILE (New York) considered that every analytical situation was a synthetic situation and vice versa and to separate them was a neurotic procedure

Dr J M ROMBOUTS (Holland) spoke of psychotherapy and the development of personality He showed how weakness and retardation were at the basis of many mental adaptation The psychic content of the organism followed an undulant line it represented the synthetic vital impersonal side and always strove towards over compensation The mental content was personal detached and analytical striving along a straight line to an imagined object with as little adaptation as possible *The two principles inevitably conflicted* sometimes until apparent failure and breakdown but even then the psyche continued to work In the first part of life the task of psychotherapy was to prepare the individual for life with all its difficulties and possibilities to strengthen the courage and show the possibilities of fresh growth inherent in every disappointment In the second part of life the patient should be helped to realize his membership of the whole of mankind and the universe

Neuro'ogical Study of Hysteria

Dr F POLLAK (Czechoslovakia) speaking on a neurological study of hysteria said that psychosomatic disturbance might show itself in the ocular mechanism The eye was a valve so to speak through which psychosomatic forces passed from one level to another Hysterical disturbances of sight could be explained in anatomical and functional terms Hysterical disturbances of sensibility did not follow anatomical rules and the distribution of the lesions bore no relation to the spinal innervation Focal disorders sometime produced ocular symptoms similar to those which had habitually been *ascribed to hysteria but with no suspicion of wish fulfilment* This hypothesis partly explained the symptom of auto copy Barbitone poisoning could produce quasi hysterical symptom The physical and psychic mechanisms were separated so to speak by a membrane like that which separated the blood from the cerebrospinal fluid The permeability had a certain normal value for the maintenance of balance but in disease it might be much decreased or increased In most psychoneurose such as obsession it was decreased in hysteria it allowed free mingling of the psychic and physical contents Hysteria followed the rules of general organic neurology in *the symptoms which were produced* by the resulting releases of energy Dr Pollak related the case of a country girl who suffered from a typical hysterical anaesthesia of the right side after an affray on her farm Organic causation was eliminated A few weeks later she showed a fully established syringomyelia of the right side of which the hysterical symptom had been a prediction

Dr E WITTKOWER gave an account of some personal studies in ulcerative colitis on forty-one unselected patients Sufferers from this disease he said frequently referred it to worry and seemed obviously mentally abnormal His patients could be classified into several groups *but, except for the* common factor of gross emotional disturbance of onset in more than half and of long standing psychological abnormalities and disorders in nearly all there was no constant aetiology

Problems of the Mature Personality

On July 31 Dr WILLIAM BROWN spoke on psychological problems of the mature personality He said that the age of maturity for his purposes was the man who was happily married Marriage with its need for responsibility and the binocular view of life might give rise to disturbances affecting feeling and outlook The great danger at every stage of mature life was retrogression to a previously occupied

position Deep mental analysis helped the individual to gain an insight into the persisting effects of his earlier experiences The danger of narcissism or self-admiration or self pity was ever present It was often subtly continued by making the marriage into a mutual admiration society, or forcing the children into being parts of the parents personality A man less often chose a profession than was chosen by it, and in mature life he might turn back to earlier and more primitive ambitions with disastrous results Sublimation was one of the most fundamental problems of the mature personality a movement forward to the fuller development of the personality The individual must consent finally to the surrender of some personal ambitions for himself and find a philosophy to meet the needs of his advancing years Much help could be given here by analysis in the building up of a supratemporal and duly co ordinated system of values and a serene and courageous spiritual outlook The central problem was ethical

Dr H VON HATTINGBERG (Berlin) remarked that the literature gave the impression that there was no problem of will This was wrong The good analyst in practice, taught the patient how to will The study of will was necessary to bring analysis into relation to the remainder of psychotherapy Dr BROWN answered that analysis gave great insight into the nature and control of will He declared vigorously that the study of values through philosophy was of the greatest importance to the psychotherapist

Dr A REPOND (Switzerland) delivered an address on "Le Demon de Midi —psychological troubles of the fourth decade of life such as outbursts of emotion, irregular love affairs and religious conversions He had found that crises of this kind occurred nearly always in persons with a certain abnormal youthfulness of temperament and body, and sought for an explanation in factors which had hindered the normal sexual development of puberty According to the epigenetic theory, the ovum contained primary centres of organization which induced the development of secondary centres Growth was thereafter the work of a series of relays, coming into operation successively Their potentialities might be varied by factors of inhibition or excitation Dr Repond drew an analogy in the development of the psycho sexual function when this was inhibited energy might be stored up, to be released much later in life and to produce the functions they should have produced much earlier, to the disturbance of the patient s social adaptation

Professor RUMKE remarked that many of these persons would accurately picture their whole emotional life history in the changes of mood which they underwent in four weeks He thought these patterns had little or nothing to do with endocrine changes

Infantile Anxiety

Dr KARIN STEPHEN took as her subject the development of infantile anxiety in relation to frustration, aggression, and fear This disorder she said was the outcome of an internal deadlock in which desire rage, and fear became involved in a vicious circle each augmenting the other and inhibiting its discharge Projection on to the environment merely perpetuated the vicious circle If the circle were broken by reversing the flight reaction fear, rage and self-frustration might be reduced and a real solution of the problem achieved

Dr THEODORE FAITHFUL declared that the subject was of primary importance to the work of the whole conference Rage and hate were part of the male personality anxiety was a female reaction and most often due to the masculinity of the mother or nurse It was unless fixated a normal expression of the feminine side of the self

(To be concluded)

On the occasion of the centenary celebration of Dalhousie University Halifax Nova Scotia, the honorary degree of LL D is to be bestowed on August 17 upon three representatives from Great Britain Lord Macmillan, Sir Walter Langdon Brown, and Professor Ernest Barker

THE EPIDEMIC SITUATION IN CHINA

That the continuation of hostilities in China would have extensive epidemiological repercussions was anticipated when the League of Nations Units—referred to in an article in the *British Medical Journal* of July 2, 1938, p 33—were dispatched from Europe The mass movements of refugees and of troops on an unprecedented scale, the flooding that followed the breaking of the dykes of the Yellow River, and the lowered resistance of a large section of the population, together with the great strain put on the local administration in many districts, have resulted as was expected, in a widespread epidemic of cholera, affecting particularly the central and south western parts of the country To deal with this emergency the Chinese Government made great efforts, particularly in the direction of preparing cholera vaccine, but in view of the urgency and the enormous quantities required it was compelled to seek help from outside

Control of Cholera by Vaccine

The Government therefore applied to the League for assistance in obtaining as soon as possible six million doses of cholera vaccine In these circumstances the League, after placing an order for immediate delivery of one million doses of vaccine at the nearest bacteriological institute, invited the collaboration of national institutes of countries participating in the work of the League s Eastern Bureau at Singapore as well as those of Europe and the United States To date the Eastern Bureau reports gifts of half a million doses each from Australia and Ceylon, and one million from the Philippines (Red Cross), the Pasteur Institute at Hanoi having previously given 250,000 doses From Europe the State Serum Institute of Copenhagen is sending 130,000 doses the Cantacuzene Institute of Bucarest one million doses the School of Hygiene at Zagreb half a million doses, and the Ministry of Public Health of Turkey one million doses The Egyptian Ministry of Health have dispatched 180,000 doses From South America the National Institute of Bacteriology Buenos Aires offered 200 000 doses The United States Government has informed the League that the American Red Cross are shipping immediately three million doses to China

It is this work in connexion with the control of cholera which is the immediate preoccupation of the three League Units attached to Chinese Health Units, one of which is working over areas relatively close to the Yellow River in North China with headquarters at Sian, one is in Central China with headquarters at Changsha, and one in South West China with headquarters at Nanning In the last few months large quantities of material have been sent out for the provision of laboratories equipped both for diagnosis and the preparation of vaccine, saline apparatus, and syringes for inoculations

General Measures against Infectious Diseases

Though in face of the existing conditions the work of the League Units is concerned for the time being chiefly with cholera control, the work already done in connexion with public health generally and epidemiology is very considerable This has been directed particularly to achieving practical lasting results, and among the principal of these is the encouragement given to the Chinese Government in the extremely difficult work of protecting the health of the civil population The Government has created no fewer than one hundred health units to serve particularly in rural districts as well as three large anti epidemic units each consisting of five 150 to 250 doctors and nurses to deal with epidemic problems in the Northern Central and Southern areas of the country In addition to these units and their equipment and supplies the National Government has granted 160 000 dollars to the League of Nations Epidemic Commission for its present activities

Small-pox, Typhus, Malaria

In regard to the more directly technical work of the League Units mention should be made of the great care

of small pox vaccination carried out by all three units in which large quantities of both wet vaccine made locally and dry vaccine from Java have been utilized The control of typhus has been done on an extensive scale particularly by the unit in the North through the use of vaccine as well as by the establishment of delousing stations the general supervision of the sanitary conditions of refugee camps and the institution of hospital for infectious diseases Malaria work has been undertaken on a wide scale especially in the Central and Southern part of China no less than two tons of quinine having been sent out by the League for this purpose

Syphilis among the refugees has called for special work as well as urgent nutritional conditions Considerable quantities of rabies vaccine have been prepared in the laboratory of the Northern Unit and distributed widely to hospitals and mission stations Finally the personnel have extensively engaged in surveys in connexion with particular problems such as plague or general public health conditions especially in the refugee camps

The reports received invariably emphasize the increasing need for medical work generally and particularly for the epidemic work on which the League Units are engaged The Chinese Government has recently applied to the League for the continuation of this collaboration for another financial year (1939) in order to consolidate the work of which the League Units have already built the foundations

ANNALS OF MEDICAL HISTORY

The May number of the *Annals of Medical History*[1] opens with a biographical sketch of Linnaeus physician and botanist by Dr H Larsson of Detroit who dedicates it to the memory of that brave group of his countrymen who in the year 1638 founded the Swedish settlement on the Delaware The frontispiece which like the portrait on the cover is different in each instalment is that of Johannes L Bausch (1605 65) a distinguished physician who suffered from major trigeminal neuralgia and according to Dr Lewis was the first authentic case on record for what the Arabian school described was really facial paralysis the error being due to mistranslation Dr C Elgood formerly of Teheran now of London presents the earliest account of syphilis in the East given in 1501 by a little known author whose only work was *The Quintessence of Experience* That the author of eleven hundred pages on physiology who used the southern alligator for his experiments should be so forgotten that the date of his death somewhere between 1866 and 1879 is unknown must be exceptional but this is the sad case of Bennett Dowler who according to Dr Meek was a controversialist not unaware of his own peculiar merit Edna and Theo von Storch reproduce the description given of epilepsy in the thirteenth century by Arnold of Villanova The history of medicine in Southern California from a very early date in the sixth century is begun by Dr Shuman of Los Angeles

Sir Philip Crampton Smyly who is credited with the introduction of the laryngoscope to Ireland in 1860 was born one hundred years ago He was President of the Royal College of Surgeons in Ireland and in musical circles he was honoured with the presidency of the Hibernian Catch Club in Dublin He died in 1904

ONE HUNDRED AND SIXTH ANNUAL MEETING

of the

British Medical Association

HELD IN PLYMOUTH, JULY, 1938

THE SECTIONS

SUMMARY OF PROCEEDINGS

During the next few months there will be published in the BRITISH MEDICAL JOURNAL *the opening papers communicated to the Scientific Sections of the Annual Meeting at Plymouth The reports of discussions continued from last week (p 250) are intended to give members who were not present a general idea of the proceedings*

SECTION OF MEDICINE

Thursday July 21

Anxiety States

With Dr DONALD HUNTER in the chair Dr T A ROSS opened a discussion on anxiety states in general and industrial medicine Dr Ross's paper was published in the *Journal* of July 30 (p 209)

Sir HENRY BASHFORD continuing the discussion with a paper on the anxiety factor in industry spoke of his personal observations over a period of thirty years as Chief Medical Officer to the Post Office The employees in this industry numbered 270 000 In some respects they were a selected group as they were admitted only after initial medical examination moreover the prospect of a pension and the sick pay available for fixed periods conduced to a sense of security among these workers As an example of an anxiety state among Post Office employees he mentioned telegraphists cramp in a very large proportion of these patients apprehension of error and distrust of the unseen critic contributed to the trouble This disturbance had practically been abolished since the discontinuance of Morse and the introduction of teleprinters and other machines On the basis of sickness certificates the speaker computed that among men only one twenty third of the total sick absence was due to nerves neurasthenia neurosis or similar states The proportion among women was approximately double Retirements through sickness were more frequent among women this disparity being due to the fact that the disturbances of the menopause frequently coincided with the assumption of new or more serious responsibilities in their employment The chief of a department might exercise great influence on the health of his subordinates an exigent or self pitying attitude readily inducing invalidism in the staff Sir Henry employed an initial thorough insurance type of examination in such an investigation anxieties or clashes of temperament were frequently brought to light This often indicated the line of treatment or management most likely to help Regarding the frequency of neurosis he thought that the figures often given in the medical or lay press were too high In a group of fifty five applicants for Post Office appointments a psychological examination had been made one third were said to have serious psychological symptoms but some years later when their records were reviewed it was found that all except one had normal sickness records and their character reports were excellent

Dr K SHIRLEY SMITH spoke on the cardiac aspects of the anxiety states In a series of sixty two patients suspected of heart disease due to or aggravated by accident or strain he

found that approximately two thirds must have had cardiovascular disease before the accident In the remaining third disability was due to symptoms such as palpitation breathlessness nervousness left mammary pain, and insomnia, but no evidence of organic disease could be found The symptoms in the great majority were undoubtedly genuine, and he regarded them as expressions of disorder in the autonomic nervous system At first at any rate, these symptoms were nothing to do with anxiety and the use of the term compensation neurosis' was often a grave injustice Exactly comparable conditions occurred after illnesses or accidents in which no question of compensation could arise At a later stage anxiety and compensation might colour the picture These patients usually became permanently unfitted for strenuous work contrary to frequent assertions, little, if any, benefit accrued from conclusion of litigation He would like to see a concerted effort made to rehabilitate these men, who were so often judged capable only of light work which in practice did not exist in the labour market Dr Shirley Smith considered that the cardiac neuroses formed a very important proportion of cardiological practice Treatment must be founded upon a basis of moral support and reassurance, long periods of rest in bed undue solicitude continued medication and frequent examinations were all undesirable

Dr ELIZABETH CASSON (Bristol) emphasized the great value of occupational therapy Where rehabilitation centres had been organized they were producing very good results She felt it was important that the doctor's advice should be obtained as to the type of work or craft best suited to the individual patient Schemes of this kind could be of great assistance to the psychologist

Dr H F BELL WALKER (Balfour, S Africa) said that he came from a part of the world where neurosis scarcely existed The multiplicity of sensory impressions received in the course of life in a populous community must lead to continued 'sense repression' This, and the limitation of occupation to some small field, must play a part in the production of neuroses He thought it was difficult to be mentally normal when living in a crowd

Dr MARGARET MARTIN commented on the frequency of neurosis in women at middle age Very often a woman, after bringing up a family, felt at a loose end and that she was of little value to the community In consequence she was liable to concentrate upon trivial symptoms An interest outside the home in some occupation or craft was often extremely beneficial

Dr J D SIMPSON (Cambridge) referred to a case in which an anginal attack had been succeeded by an anxiety state, with the result that attacks of pain recurred thirty or forty times in the day He had never seen cardiac damage result from rowing except in one case in which the antra had subsequently been found to contain pus Contrary to general belief, anxiety and its consequences were very common among athletes

Dr F A ROPER (Exeter) agreed that it was undesirable to speak of a 'weak heart' to a patient with a cardiac neurosis He advocated that an explanation should be made in terms of nervous regulation of the heart Dr W S MACDONALD (Leeds) spoke of the causation of anxiety states by head injuries and described two cases to illustrate this relationship He had noticed that the blood pressure was frequently low in patients with cardiac neurosis and inquired whether this was a general finding Dr ELLIS MURTHY (Brisbane Queensland) regarded discussions of this sort as very valuable to those who worked in outlying parts He did not agree that anxiety states did not exist in sparsely populated areas Boundary riders and others who might make no contact with humanity for three to six weeks at a time were prone to develop these disorders He emphasized the importance of distinguishing between primary anxiety states and those neuroses engrafted upon organic disease Dr W E LISHMAN (Plymouth) thought that Dr Ross had placed the incidence of neurosis too high On the other hand Sir Henry Bashford's figures were too low, partly because they concerned picked lives who had the additional advantage of a sense of security He believed that the problem should be tackled in the earlier years and advocated the extension of child guidance The decay of religion was in part responsible for the increasing frequency of nervous disorders

Dr DONALD HUNTER held that the outlook from the standpoint of medical education in these matters was not so bad as Dr Ross feared There were only a few teachers in the hospitals who were failing to teach these aspects of general medicine The student undoubtedly imbibed a proper method of psychological approach from many with whom he came into contact, including teachers, residents, and sisters

Dr ROSS concluded the debate with a reference to Dr Halliday's work in Scotland In this investigation examination by specialists of 1,000 cases of certified organic disease among workers revealed the fact that 33 per cent were actually free from organic disease He thought that this consideration reduced the value of Sir Henry Bashford's figures, since these depended upon certification of the same kind He agreed that child guidance helped in making the best of poor material and in aiding the better

SECTION OF SURGERY

Thursday July 21

Cancer of the Breast

With Professor JOHN MORLEY (Manchester) Vice President of the Section, in the chair, Mr G GORDON TAYLOR opened a discussion on cancer of the breast

Mr Gordon-Taylor spoke as one who had eschewed except for a very short time, the method of post operative irradiation as a supplement to radical operation in cases now commonly classified as Group I, in which the disease is clinically apparently confined to the breast, and Group II in which the only clinically apparent spread is to the axillary glands He had always regarded radical surgery as the method of choice in almost every patient belonging to these two categories, but paid a tribute to his radiological colleagues for their help with the Group III or advanced cases From 1908 to 1938 he had performed the radical operation in 600 instances and had been successful in tracing the after result in all but seven of these patients Of Group I cases operated upon up to 1928, 113 in number, ninety five (84 1 per cent) had survived ten years of 204 Group II cases in the same period there were sixty ten-year survivals (29 4 per cent) of the forty-six Group III cases only three (6 5 per cent) had survived In another statistical table embracing patients operated upon up to 1933, the figures in the three groups for five or more years survival were 85 9 per cent, 39 9 per cent and 9 8 per cent respectively He had had 155 patients who had survived for more than ten years after radical mastectomy, thirty three had lived for between fifteen and twenty years six had survived for between twenty and twenty five years, and eight had survived for twenty five years The actual operative mortality had been 1 3 per cent

In an attempt to ascertain the value of pre and post operative irradiation Mr Gordon Taylor said he had sent out a questionary to seventy two British colleagues regarding their practice in Group I and Group II cases Of the surgeons interrogated 25 per cent made no use of irradiation as a supplement to radical operation 44 per cent used some form of irradiation for every radical mastectomy, 29 per cent used irradiation in Group II cases after radical operation and 2 per cent employed irradiation alone without radical removal There was undoubtedly a trend towards the supplementary use of irradiation, but there were no figures published to support the belief in its value He thought that it was impossible to draw any fair conclusions between the various treatments unless they were applied in parallel series of cases graded on a histological basis

Mr GEOFFREY KEYNES said he had wished to dispense with so radical and mutilating an operation as Halsted's was, but he asserted that excellent results were to be obtained by local operation reinforced by efficient radiological treatment, or by

radiological treatment alone He did not think it necessary to remove the whole breast and pectoral muscles nor did he think it essential to dissect the axilla While the size of the primary tumour might limit the value of radium so that local excision was necessary the axilla could be satisfactorily irradiated by means of interstitial needles His five year survival rates were 71 1 per cent 30 5 per cent and 19 4 per cent in the three groups respectively These figures compared very favourably with previously published statistics of radical operations but were not so good as Mr Gordon Taylor's in Group I Mr Gordon Taylor however represented the best in the exposition of breast surgery Certainly others had fallen below his high standard Mr Keynes claimed no finality for the particular method of interstitial irradiation he employed It might be that improved deep x ray therapy would in time supplant it While x rays could be made to cover a wide area radium could be applied with greater local intensity From the psychological point of view his conservative methods were of great value The actual preservation of the breast was not the only thing to be considered in this connexion fear of the radical operation made many women averse from examination before the disease had spread widely

Mr CECIL ROWNTREE suggested that both Mr Gordon Taylor and Mr Keynes laid themselves open to criticism by urging standard treatments for a disease so varied in its symptomatology and so protean in its pathological manifestations He thought that in the class of case regarded as operable a number of patients by reason of intercurrent disease such as diabetes or tuberculosis were unfit for major surgery Again the incidence of recurrence in young women was so high that there was no point in submitting a woman under 30 to the radical operation In all these cases he employed interstitial radium In the very old metastasis was so slow that local excision was sufficient The site of the growth was of importance Growths at the extreme upper limit of the breast or at the sternal margin necessitated awkward and difficult surgery and had a bad prognosis These cases also were best treated by interstitial radium Regarding the remaining cases—the great majority—he thought the condition of the axillary glands was the guide as to what should be done Where these were heavily involved he followed Mr Keynes's technique In all other cases he divided the sternal portion of the pectoralis major at an early stage in a proposed radical operation If then he found involvement of the axillary glands clinically not apparent or at least not very advanced of such a degree that meticulous scraping of the upper axilla would be required he completed the operation in a minor key dealing with the axilla by irradiation otherwise the case was dealt with by the radical operation

Dr J H DOUGLAS WEBSTER said that at the Middlesex Hospital one half to two thirds of all patients with primary cancer of the breast were already in an inoperable stage of the disease when first medically examined The numbers treated by radiotherapy alone were increasing yearly Advances in radiotherapeutic methods and technique were so great as compared with five or ten years ago that as yet the results at five years could not be properly compared with surgical figures He emphasized the value of pre and post operative irradiation because of its influence on the outlying clinically undetectable cancer cells In Group I there would be 100 per cent of cures by operation and no necessity for irradiation if it were possible to group the cases on a pathological basis instead of on clinical grounds

Mr W SAMPSON HANDLEY thought that Mr Gordon Taylor's figures had settled the argument at least for the time being, in favour of radical operation In his opinion the internal mammary glands were involved just as rapidly as the axillary nodes He considered it dangerous to rely on irradiation alone in the treatment of the axilla and thought that interstitial radium was suitable only in inoperable cases and for growths situated peripherally In addition operation facilitated the task of post operative irradiation Mr D C L FITZWILLIAMS considered himself more unorthodox even than Mr Keynes in his conservatism He thought it was possible to diagnose the disease while it was still local but only by transillumination Mr CECIL JOLL wished to urge that good as Mr Gordon Taylor's results were following radical operation there was room for improvement especially in Groups II and III The results obtained at the Royal Cancer Hospital seemed to point to the advantages of combined methods over surgery alone

The Chairman Professor MORLEY was afraid that the discussion had left a vaguene s as to the place of various methods He thought that other methods were only complementary to surgery and that there was a tendency to turn away from radium to post operative x ray therapy He had seen severe neuritis following interstitial radiation He was not moved by Mr Keyness plea for preservation of the breast on psychological grounds the ultimate result was the all important thing

At the conclusion of this discussion Mr H C EDWARDS (London) gave a lantern slide demonstration on gastroscopy

COMBINED SECTIONS OF OBSTETRICS AND PUBLIC HEALTH

Thursday July 21

Prevention and Control of Puerperal Sepsis

With Dr W ALLEN DAILY *President of the Section of Public Health* and Hygiene in the chair a discussion on the prevention and control of puerperal sepsis including the medico legal aspects was opened by Profes or R W JOHNSTONE (Edinburgh) followed by Dr ETHEL CASSIE (Birmingham) Dr A MASSEY (Coventry) and Dr R M FRY (London) whose papers will be published in next week's *Journal*

Dr R W DURAND who followed with a paper on the legal aspects of puerperal sepsis said that the legal responsibilities in regard to puerperal sepsis did not differ greatly from those in other diseases In every case whatever the disease the doctor was required by law to exercise reasonable care and skill To-day it was the exception and not the rule for practitioners to wear masks and gloves when attending confinements a doctor would not necessarily be considered negligent because he did not do so It might well be however that in five or ten years time the common practice would have so changed that to attend a confinement without wearing a mask and gloves would be considered an act of negligence If a doctor had not exercised that amount of care and skill which might reasonably be expected of him having regard to existing practice in similar circumstances he might be charged with malpractice If it was shown that it was or should have been within his knowledge that potentially he might be carrying infection and had not taken sufficient precaution against transmitting it then it was certainly possible that he might be held to have acted negligently Dr Durand pointed out that doctors employed by a hospital or other authority were in the same position as private practitioners It was the duty of a doctor in administrative charge of an institution to see that the conditions were such that safe midwifery could be carried out there If advisable he must close the hospital or certain wards until such time as danger of infection had passed and should acquaint other doctors concerned with the facts A medical officer of health who had issued specific instructions to a midwife could not be held responsible if she failed to carry them out but adequate supervision must be exercised Nurses and midwives were within the scope of their training responsible for their actions

Dr I GREENWOOD WILSON (Cardiff) described the procedure adopted in the Municipal Hospital Cardiff There were two labour wards one for clear and normal cases and one for suspected cases of infection Both in the hospital and in domiciliary practice masks were worn All municipal midwives were insured against legal damages in respect of acts of omission or commission

Dr W C W NIXON referring to the subject of masks asked why the anaesthetist should be privileged not to wear

one and why with the delivery of the placenta the nurse should immediately remove her mask He referred to the value of dettol in the form of a 30 per cent cream for the hands and vulva, and said that his experience in the Far East confirmed the validity of Colebrook's reports of the reduction in the incidence of infections due to haemolytic streptococci He commented on the myth that haemolytic streptococci were not found in the Tropics and recorded that in 1936 the incidence of puerperal infections with these organisms in the Hong Kong University Obstetric Clinic was almost the same as that found at Queen Charlotte's Hospital

Sir EWEN MACLEAN (Cardiff) referred to the help the medical officer of health could give to the practising obstetrician He said that local authorities could have in large measure that reduction in maternal mortality which they were willing to pay for Dame LOUISE MCILROY agreed with Professor Johnstone's views regarding the importance of raising the resistance of the patient, and emphasized the need for early and efficient ante natal supervision Too much stress was at times laid on pelvic measurements and not enough on the general condition of the patient herself Her experience was that the incidence of puerperal infection was not high in hospital practice Mr L CARNAC RIVETT said that every doctor attending an infectious case or dealing with cases of whitlow or otorrhoea should wear a mask and gloves In his opinion dental caries did not cause puerperal sepsis but pyorrhoea and gingivitis were of more importance than was generally realized

Mr JAMES W G H RIDDELL (Plymouth) declared that small wards of one or two beds were safer than large wards He pointed out that in osteomyelitis if the bone was trephined a positive blood culture could be obtained in a few minutes Therefore, in maternity cases requiring instrumental or manual delivery or Caesarean section sulphanilamide should be given before operation so that at the moment of delivery this drug was circulating in the blood Dr LETITIA FAIRFIELD considered that the statistics for normal booked cases should be shown separately from those for suspected emergency cases, otherwise the records might be misleading She emphasized the importance of removing every case of puerperal pyrexia from the maternity ward, as other patients might contract infection in the first few hours She considered that in the small hospitals an experienced doctor should be responsible for the control of cases of puerperal pyrexia or sepsis It should not be left to the matron to deal with the problem Dr J PRESTON MAXWELL (Pekin) said that for twenty years all maternity patients at the Peiping Union Medical College had had a stand up or shower bath on admission Tub baths were prohibited for three weeks before labour on account of the danger of septic fluid entering the vagina He agreed with Dame Louise McIlroy that ante natal work should begin when pregnancy started Dr F E CAMPS (Chelmsford) commented on the danger in small country hospitals of the hospital "runner" carrying streptococcal infections from the medical or surgical ward to the maternity ward, and advised against the interchange of nurses between these wards

Dr MABEL RAMSEY (Plymouth), Dr F MCLAUCHLIN and Dr E LEWIS LILLEY (Leicester) also took part in the discussion

---

COMBINED SECTIONS OF ORTHOPAEDICS AND PHYSICAL MEDICINE

Thursday, July 21

Rheumatoid Arthritis

With Mr W W RENTOUL (Truro) in the chair, Dr WILFRID EDELCOMBE (Harrogate) opened a discussion on rheumatoid arthritis by saying that in the B M A report of five years ago rheumatoid arthritis was classified as primary or secondary, yet the only real distinction appeared to be whether or not a focus of infection was discovered The infective origin of the condition was not proved and bacteria their toxins allergy, and the virus were still all incriminated Both the seed and the soil were necessary, in his view for the onset of the condition He stressed the value of the sedimentation rate and the need for standardization of the methods of carrying it out A hyperthyroidic factor was unlikely, but the effect of ovarian secretion was more possibly causative In treatment vaccines were tending to fall into disrepute but the value of gold was becoming more and more recognized Spa treatment was of great value, more because of the presence of all facilities for treatment—including specialist medical service—in one place rather than on account of the specific effect of the particular "water"

Mr NORMAN CAPENER (Exeter) pointed out the value of an orthopaedic hospital as a treatment centre for rheumatoid arthritis, and then proceeded to explain the position of physiological rest for various joints, giving a detailed scheme for charting deformity and progress He advocated the use of plaster immobilization *with padding*, and described a method of correcting flexion deformity of the knee by cutting the back and sides of the plaster at the level of the knee joint and inserting wedges posteriorly to increase extension

Dr K R COLLIS HALLOWES (Torquay) described two chronic cases in which there was dramatic recovery after operation for acute abdominal emergency (gall bladder and appendix) although previously there had been no evidence of intra abdominal disease While deprecating the value of vaccines, he strongly advocated gold therapy not only in rheumatoid arthritis but when this condition was coupled with osteo-arthritis He made a plea for accuracy in the prescription of physiotherapy and also for early expert treatment, if only for a short time in order to start the patient along the right lines He did not believe that a warm climate was prejudicial to treatment, but that rest in cheerful surroundings was essential

Dr G D KERSLEY (Bath) drew attention to the value of plaster immobilization as an adjunct to physiotherapy hydrotherapy in the treatment of rheumatoid arthritis The plaster had to be light strong, and capable of being removed and replaced for treatment For the wrist short slabs were used, and for the knee the whole leg hip to foot was encased the plaster being divided and removed for half an hour daily During this time mud packs were applied massage was given for the muscles above and below the joint and movement was carried out for a few times only, through its full range, in a hot pool Corrective serial plasters he said, were applied in the best position obtainable if deformity was already present They were removed daily for manipulation in the hot pool Many knees could be straightened that had been flexed for years and this method appeared to give results superior to those of continuous traction

Mr W D COLTART made a plea for the earlier application of orthopaedic principles, and also stressed the need for full co operation on the part of the patient, who should have the programme of treatment explained to him beforehand He stressed the difficulty of carrying out manipulation when an active focus or raised sedimentation rate was present The shoulder was a particularly 'difficult' joint, and where extreme pain was present any attempt at regaining abduction had to be postponed In some cases both weight extension and manipulation, followed by plaster, had to be employed It was surprising how much could be done for the finger when deformity had arisen The use of support in the form of a calliper and insoles was often invaluable

Miss FORRESTER BROWN (Bath) mentioned the importance of occupational therapy in improving muscular control of the joints, and also reminded the meeting that Sir Robert Jones many years ago, was the originator of serial plasters Mr H J SEDDON likened the problem of rheumatoid arthritis to that of infantile paralysis and tuberculosis and thought that it should be a notifiable disease and that local authorities should contribute to the expense of its treatment Mr C M KENNEDY (Plymouth) supported Mr Seddon in his plea for help from local authorities He also drew attention to gonorrhoea as of aetiological importance in cases resembling rheumatoid arthritis Mr K H PRIDIE (*Bristol*) held that gonorrhoeal cases could be recognized by x ray exam-

tion and also drew attention to the value of starvation and colonic lavage in treatment. Dr. W. S. C. COLEMAN felt that the tendency was for the treatment of rheumatism to become more orthopædic but that from the orthopædic side the interest was still principally concentrated on the end result and on operative surgery rather than the earlier stages. Medical orthopædics was the outlook required by everybody who treated this group of diseases. It was the only way in which rational treatment would become possible on an organized scale. He stressed the importance of follow up treatment. Dr. A. R. NELIGAN (Droitwich) spoke of the pre-rheumatic state characterized by circulatory and sensory changes in the extremities, abnormalities in the sweating mechanism, wasting of muscles and fatigue and advised that such cases should be watched carefully. Mr. S. T. IRWIN (Belfast) mentioned the difficulty of regaining good quadriceps function after removal of the patella and advocated active rather than passive movement to aid maintenance of muscle function. Mr. W. W. RENTOUL (Truro) doubted whether any infective factor existed in menopausal arthritis and also agreed with Mr. Capener about the need for padding in plasters.

Dr. WILFRID FOLCOMBE, replying, said he thought there was a tendency to temporary improvement in rheumatoid arthritis when pregnancy ensued. Many patients benefited by a change in diet with reduction in starch and increase in protein, as many had suffered an unnecessary and harmful restriction of the latter.

SECTION OF DISEASES OF CHILDREN

Thursday, July 21

Some Nutritional Problems of Childhood

At a meeting of the Section of Diseases of Children on July 21, with the President, Dr. F. M. B. ALLEN (Belfast), in the chair, *Professor L. G. PARSONS (Birmingham)* delivered the Dawson Williams Memorial Lecture, which was entitled "Investigations into some Nutritional Problems of Childhood."

Professor Parsons dealt principally with work on coeliac disease carried out in Birmingham by himself and an enthusiastic band of colleagues, and pointed out how many deficiency diseases might arise in the course of coeliac disease such as rickets, tetany, cataract, scurvy, night blindness, pyodermia, xerophthalmia, atrophic tongue, beriberi, microcytic and macrocytic anæmia, dental hypoplasia and stunting of growth. Soon after the war he continued, in the course of treating a child with coeliac disease he found that the patient developed rickets which was successfully cured by ultra-violet irradiation. A subsequent investigation of the effectiveness of the sunlight available in Birmingham showed that the period of healing rays was limited to about twenty-eight weeks in the year. Another deficiency disorder met with in coeliac disease was anæmia, and this was commonly the result of a straightforward deficiency in iron. Professor Parsons explained that some of the rarer types of blood changes indicated that the earliest phase in the iron deficiency state was actually an increase in the number of the red cells but a decrease in their size. Calcium deficiency appeared to play some indirect part in the anæmia of coeliac disease. It was clear from the work which had been done that there was poor absorption not only of fat but also of carbohydrate in coeliac disease. It was found that sugar tolerance could be greatly improved by the administration of certain liver extracts either by mouth or by injection. Vitamin B_1 (as marmite) was also now given as a routine measure in view of further work that had been done on carbohydrate tolerance in coeliac disease.

Empyema

Miss GERTRUDE M. A. HERZFELD (Edinburgh), Vice-President of the Section, then took the chair when Dr. H. L. WALLACE (Edinburgh) opened a discussion on the treatment of empyema in children. He pointed out that this was essentially a disease in which there should be close co-operation between physician and surgeon. To avoid personal preferences he based his remarks upon a general review of the treatment of empyema as practised at the Royal Edinburgh Hospital for Sick Children during the past fifteen years: this comprised 363 cases of which fifteen dying within forty-eight hours of admission were excluded. Dr. Wallace then reviewed the mortality rates and length of time in hospital for three age groups—under 2 years, 2 to 5 years, and 5 to 12 years—for each of the following methods of treatment: repeated aspiration, drainage by cannula aspiration, drainage by closed suction thoracotomy and open drainage, drainage by resection of rib (closed and open). Regarding the first three as conservative measures and the last two as radical, Dr. Wallace showed that both as regard mortality and length of stay in hospital the outlook was better for those children treated radically, the general mortality being less than half that of those treated by conservative measures. Such measures were of value as a preliminary to more radical intervention, but except when the amount of the pus was very small the attempt to cure empyema by repeated aspiration alone for example merely prolonged the illness and might even endanger life. The immediate results of treatment were not significantly influenced by the nature of the infecting organism in his series.

Mr. K. C. BROCK criticized the results brought forward by Dr. Wallace on the ground that they did not appear to take into consideration the varying mortality from the disease at different periods. Defining empyema as a localized collection of pus in the pleura, he pointed out that the condition must be carefully differentiated from diffuse intrapleural suppuration often part of a general infection. In Dr. Wallace's series he continued it appeared that a high proportion of the deaths were in fact associated with general disease. He particularly wished to deal with the assessment of the correct time to drain. Other aspects of treatment included the provision of adequate drainage and the decision when to stop it. Among the factors which made for caution as regards drainage Mr. Brock considered were the type of organism (streptococcal cases calling for more delay before radical measures), the history of previous illness, the evidence of general blood infection, the general condition of the patient, and the exact duration of the empyema as distinct from other parts of the whole infective process. Early aspiration was desirable but intercostal drainage in general was better postponed for a full three weeks after the end of the antecedent pneumonic process. An empyema was never an emergency calling for immediate operation. If a child was acutely ill with an empyema it was likely that some general infection or other area of suppuration was the cause of this rather than the empyema, and hence delay in radical local measures was undesirable. The temperature chart must be carefully studied, and intercostal drainage only be formed when it had definitely changed from the early form associated with pneumonia to the swinging form of septic infection. The character of the pus—that is, the thick type—was also a useful guide as to when the time had arrived for drainage. Mr. Brock was rather distrustful of the too early use of the intercostal catheter and employed it only as a stop-gap for two to three days. In his view resection of a rib for the provision of adequate drainage was essential in most cases eventually, but should never be part of the early treatment in young children.

Dr. A. BRIAN TAYLOR (Birmingham) dealt more especially with the prevention of chronic empyemata and associated disorders such as bronchiectasis, chronic sinuses and postural defects. He suggested that instead of repeated aspirations in the earlier phases of the disease it was better for the empyema, and kinder for the child to, insert early on an intercostal self-retained catheter leading to under-water drainage: this allowed the toxic fluid to drain away as it formed and encouraged expansion of the lung. This procedure could be carried out in even very ill children in their beds. After about a week, there was less toxæmia, the pus thickened and rib resection could be carried out still with a water seal since this avoided frequent dressings and permitted gentle irrigation. The time to remove the tube was when the cavity in the pleura was obliterated, not when drainage ceased, and in determining this point the use of lipiodol and x-rays was most valuable. Dr. Brian Taylor considered that the best position for drainage

was in the axillary line about the fifth or sixth space since this was the physiological point of election and most comfortable for the child Breathing exercises of the inspiratory and postural type should be begun as soon as temperature and toxæmia had subsided

Dr LINDSAY A DEY (Sydney) thought that bacteriological study of the pus was of the greatest importance he was loath to drain early in cases of streptococcal origin But he agreed that delay in drainage might be responsible for poor ultimate results

Dr F M B ALLEN (Belfast) said that in tackling empyema he first satisfied himself as to the presence of pus in the chest and then determined the organism present The general condition of the child must also be most carefully considered, since empyema might be part of a general pyæmic state

Mr OFFICER BROWN (Melbourne) from an extensive review of empyema in childhood showed that the mortality over 2 years of age was much lower than under that age and was about the same as for adults He thought this was explained by the large number of streptococcal cases in young infants and the complication of empyema in measles and whooping cough in which a septicæmia was probably present In treating by the method of closed drainage he favoured the maintenance of a high negative pressure Cellulitis of the chest wall was an occasional cause of death and was possibly due to the use of too many sutures

Professor L G PARSONS (Birmingham) thought that the use of the terms 'synpneumonic and metapneumonic' empyema was questionable, as this focused attention too much on the possible pneumonia and not enough on the fact that the very ill child with empyema was probably suffering from a septicæmia which explained the high mortality in young infants

Dr BURTON WOOD presumed that the list of considerations fulfilled by Mr Brock meant the use of the needle until operation appeared safe He thought that intercostal tube drainage was definitely valuable in the early stages although it was possible that the tube in some cases might lead to erosion of the ribs above and below and cause osteomyelitis

SECTION OF NEUROLOGY AND PSYCHOLOGICAL MEDICINE

Thursday July 21

States of Mental Depression

With Dr W RUSSELL BRAIN Vice President of the Section, in the chair Dr AUBREY J LEWIS opened the discussion upon states of depression their clinical and aetiological differentiation Devoting his attention mainly to the problem of classification he inquired how far a separation of the depressed states could be based upon genetic factors on the one hand and clinical factors on the other The distinction between hereditary and environmental influences was purely theoretical and could not in practice be maintained There was no reliable evidence as to the heredity of so called psychogenic depression and nothing had been proved for the other varieties On the other hand it appeared that all the tables and classifications in terms of symptoms were little more than attempts to distinguish between the acute and chronic the mild and severe The danger of the classification into manic depressive and psychogenic types lay in the assumption that there was nothing to be done for the former and that psychotherapy was alone effective for the latter Dr Lewis emphasized the importance of ascertaining whether a depression might be due to organic disease or to hysterical obsessional or other psychopathic trends Classifications should therefore be avoided

Dr DESMOND CURRAN welcomed the views expressed by Dr Lewis because they demonstrated the dangers of false simplification The application of fundamental psychiatric principles liberated clinicians from diagnostic straitjackets, and represented an advance from the attitude adopted up to within the previous few years The term depressive syndrome' was more elastic than the old conception of rigid and sharply defined disease entities The typical manic depressive existed, but was rarely met in practice while patients exhibiting symptoms characteristic of two different entities were often encountered Dr Curran submitted that physical mental and constitutional factors were inevitably operative in everyone, not excluding patients The interaction of these factors was such that the chief one could neither be found nor reasonably be inferred Therefore the general position advocated by Dr Lewis appeared indisputable Yet it might be argued that for practical purposes the neuroses could and should be differentiated from the psychoses Such a sharp distinction was not possible, and an attempt to make it was harmful if it was combined with equally rigid and untenable views on aetiology, prognosis, and treatment

Dr E A BENNET drew attention to the association of depression with early malignant disease, and emphasized the importance of repeated physical examination of depressives of the middle and later decades He agreed with Dr Lewis that states of depression were clinically separable on a quantitative estimation into acute or chronic, mild or severe But a qualitative concept of depressiveness was also required, and until the nature of depression was investigated clinicians were not in a position to assert that all depressive states were of similar quality—in other words, that they had a similar aetiology The clinical findings, however afforded no clinical basis for such a distinction and the only method at present available for obtaining knowledge of the aetiology was some form of analysis Psychoanalysts were agreed that states of depression differed quantitatively but not qualitatively Their view left unexplained the periodic swing of mood and this Dr Bennet suggested, was the crux of the matter This change of phase in mood was present in all men and in the manic depressive group exhibited a morbid intensification In the psychoneurotics there was also depression of a secondary non-periodic type which might be called psychoneurotic depression Psychoneurotic depression differed from the endogenous depression of the manic depressive both in the absence of periodicity and qualitatively Dr Bennet therefore dissented from the conclusions of Dr Lewis and Dr Curran that depressive states differed merely in degree He emphasized the distinction between the natural periodicity of mood that became morbidly intensified in endogenous depressive states and psychoneurotic depression the qualities and aetiology of which were not known

Dr R G GORDON (Bath) speaking of the neurological aspects of depression suggested that they might arise from changes in the cortico thalamic hypothalamic system The change might be imposed from above in the psychogenic group, or from below in cases in which toxic or endocrinological factors were manifest Thus Meyer had described cerebral neuritis in the deep layers of the cortex in involutional melancholia Again, depression might be profound in cases of Parkinsonism and in disseminated sclerosis Dr A E A CARVER (Nuneaton) agreed with Dr Bennet in stressing the importance of the periodic factor Alcoholics and drug addicts when treated continued to exhibit phases of depression, and on analysis, showed evidence of both endogenous and neurotic factors The same thesis was elaborated by Dr R EAGER (Exeter), who reminded the meeting that the old word lunatic" expressed the idea of periodicity

Vertigo

At the afternoon session, with Professor HENRY COHEN Vice President of the Section, in the chair, Dr RUSSELL BRAIN opened a discussion on vertigo, its neurological, otological circulatory, and surgical aspects He defined the condition as the consciousness of disordered orientation of the body in space Disorders in normal orientation might arise at various different levels in the nervous system from the cortex downwards A corresponding classification of vertiginous states could accordingly be made He directed special attention to Ménière's syndrome, and emphasized the impor-

of seeking for focal infections in this condition The efficiency of dehydration as a form of treatment was doubtful although in the light of the recent observations of Cairns and Hallpike water retention might well be a contributory factor

Mr W M Mollison spoke of vertigo as a symptom to be cured by destruction of the labyrinth Vertigo resulted from a disturbance of the balance between the two labyrinth Causes of such disturbance lay in the middle ear in the internal ear or in the vestibular nerve and its centres Middle ear vertigo was common and might be due to changes in pressure in the fluid in the internal ear brought about by changes in the position of the stapes in the oval window In practice it resulted from middle-ear catarrh secondary to Eustachian obstruction In all cases of vertigo with one-sided deafness inflation of the tube was essential to exclude obstruction as the cause Occasionally vertigo was caused by wax in contact with the membrane but since vertigo in these circumstances was rare it was evident that some predisposing cause must be present Hallpike's recent histological observations suggested that changes in the internal ear might sometimes accompany middle ear catarrh and be responsible for vertigo Although Mr Mollison had in a number of cases injected alcohol into the internal ear with good results in 76 per cent he recommended section of the vestibular root at the internal auditory meatus as the operation of choice since decree of hearing might then be preserved

Dr A Hope Gosse analysed a series of fifty unselected cases of cardio vascular disease with giddiness as a symptom The maximum age incidence was between 60 and 70 years and men were affected nearly twice as often as women The blood pressure was abnormally high in 22 per cent Heart disease based on atheroma accounted for two-thirds of the whole group It was of interest that excessive smoking was recorded in only 8 per cent Dr H G Garland (Leeds) expressed doubt whether vertigo was caused by either local sepsis or tobacco He inquired whether giving up smoking had relieved symptoms in any instance

Mr Geoffrey Jefferson (Manchester) said that he had not been impressed with the results of dehydration treatment perhaps he had expected too much In this connexion the histological observations of Cairns and Hallpike were of the greatest importance In both of their cases however cerebral oedema had been present and Mr Jefferson thought that their observation of hydrops vestibuli should be controlled in this respect His approach to the operative treatment of labyrinthine vertigo was conservative because in many instances the attacks tended to subside He advocated division of the cephalad fibres of the vestibular portion of the nerve but doubted whether this operation would ever completely replace the alcohol injection method described by Mr Mollison The latter was more suited to those who by reason of age or infirmity were unfit for the severer operation

Professor H Olivecrona (Stockholm) divided examples of Menière's disease into (1) true cases with tinnitus unilateral deafness and recurrent vertigo these had no certain anatomical basis (2) Similar cases with an obvious cause such as a tumour in the posterior fossa or middle-ear disease (3) Dandy's pseudo Menière's disease in which the disorder tended to disappear and in which therefore conservative treatment should be adopted In some examples of the first class spontaneous recovery also tended to occur But when attacks were incapacitating and frequent Professor Olivecrona advocated division of the vestibular nerve He had operated in about forty cases and most of the patients had done well

Dr H V Dicks found evidence from the opening paper that physicians and neurologists in particular recognized the importance of the psychological aspects of disorders of adjustment to the environment Of all cases of consciousness of disordered orientation in space the neurotic were the most common In the life of the unconscious as studied in the dream and in hallucinations and delusions there was a different space sense from that which normally governed man's relation to the outer world These distortions of reality sense might rise to consciousness under the stimulus of anxiety and this provided a background for the neurotic type of vertigo

Dr V F A Carver (Nuneaton) asked for information about the nature of the rhythmic pulsation perceived in the ear by many sufferers from vertigo Professor Henry Cohen said that such a pulsating tinnitus could sometimes be heard by an observer auscultating over the mastoid of the patient He had also found that attacks of vertigo might synchronize with attacks of paroxysmal tachycardia The true character of such labyrinthine circulatory disorders was however unknown He had convinced himself of the value of chloretone in Menière's disease but had been surprised to find that no good resulted from intravenous hypertonic saline or glucose

Dr Russell Brain in reply said that it was undoubtedly true that the discovery and treatment of focal sepsis in vertigo had sometimes resulted in cure Auscultation of the skull should always form part of the routine examination since this might lead to the recognition of an arterio-venous aneurysm

SECTION OF PATHOLOGY, BACTERIOLOGY, AND IMMUNOLOGY

Thursday July 21

Typhoid Paratyphoid Vaccination

With the President Dr M H Gordon in the chair Brevet Lieutenant-Colonel J S K Boyd R A M C read a paper on recent advances in the preparation of prophylactic typhoid paratyphoid vaccine as used in the British Army He said that the original vaccine used in the Army was prepared from the Rawlings strain of *Bact typhosum* of low virulence Late doubts were raised regarding the stability of this strain and Grinnell showed that vaccines prepared from recently isolated smooth strains were more effective in protecting mice from test doses of living organisms Perry Findlay and Bensted confirmed Grinnell's findings and by working on the changes produced in *Bact typhosum* by mouse passage were able to produce a strain of Rawlings which possessed the same virulence as the highly virulent strains of recent origin Further it was found that several strains of *Bact typhosum* originating from different cases in an outbreak when used as vaccines afforded a degree of protection corresponding directly to their virulence Virulence in *Bact typhosum* had been shown by Felix and his colleagues to be attributable to the possession of the virulence or Vi antigen and the criticism had been made that vaccines killed and preserved in the usual way must lose any Vi antigen they possessed so that no advantage was to be gained by the use of virulent strains In practice this criticism was not substantiated Experimental inoculations in volunteers had shown that the reaction caused by vaccines of virulent strains was no more severe than that given by the old vaccine A vaccine of *Bact typhosum* *Bact paratyphosum* A and *Bact paratyphosum* B of proved and tested virulence was therefore brought into general use in the British Army in 1935 The results of this measure could best be studied by following the incidence of typhoid fever in the British Army in India where 50 000 to 60 000 men were scattered through a country in which enteric fevers were endemic among the civil population The curve of incidence showed an upward trend until 1929 The vaccine used was then changed to embody 50 per cent of a smooth and recently isolated strain of considerable virulence From 1929 a decline in incidence occurred which was sharply accentuated in 1934 following the introduction of the new vaccine It was worthy of note that there had been no corresponding decline in the incidence of other intestinal diseases which seemed to show that the improvement in the enteric figures could not be solely attributed to an improvement in general sanitation Prior to 1934 most cases of enteric fever occurred in young soldiers of less than one year's service in India Since 1934 the distribution of such cases had been more evenly spread out over the different years of service and the new arrival seemed to possess an immunity equal to that of his more seasoned comrade It seemed probable that this was attributable to the more effective vaccine

Dr E GRASSET (Johannesburg) in a paper on typhoid endotoxoid vaccine, gave a review of the results of preventive inoculation against typhoid fever in an inoculated population of 400 000 He said that typhoid endotoxoid vaccine consisted of the derivatives obtained by treating endotoxin with formalin at incubator temperature the endotoxin was derived from killed emulsions of Vi typhoid (or paratyphoid) strains by a process of repeated freezings The atoxic product retained the antigenic properties of the original emulsion and conferred a high protection, as evidenced by mouse tests Large scale immunization of a mixed population had shown that endotoxoid could be injected with safety and in considerably higher doses than suspension vaccines The preliminary application of the method took place in 1933 and rapidly spread Information from various sources had testified to the high immunizing properties of endotoxoid—a considerable reduction in the incidence and mortality rates following its introduction as compared with the statistics of previous years during which T A B and oral immunization were employed Dr Grasset then gave a number of statistical examples in support of this contention Continuing he said that serological investigations had shown that H and O ' agglutinins to an average titre of 1/800 and 1/220 respectively were produced in 90 per cent of the subjects in the month following endotoxoid inoculation It had been ascertained that a single injection of endotoxoid of high antigenic power was sufficient to produce agglutinin titres of 1/10,000 H ' and 1/500 O ' in man Work on an insoluble alum precipitated endotoxoid showed that the protection conferred was equal to that given by the original endotoxoid By alcohol precipitation a purified antigen was obtained which, redissolved and injected into mice and rabbits, conferred a high degree of immunity and agglutination titre equal to that given by the original endotoxoid With regard to the duration of immunity appreciable H and O agglutinins were present one year after administration of endotoxoid and a comparable degree of protective immunity persisted at the end of two years

Dr H H BROWN (Worthing) suggested that the action of T A B vaccine was due to lysis of the bacteria at the site of injection, liberating endotoxoid which subsequently reached the reticulo endothelial system If any of the bacteria were destroyed by phagocytosis this portion would not contribute to the effect Thus endotoxin given subcutaneously or bacterial suspension intravenously might produce a more lasting effect than suspension subcutaneously

Dr E WORDLEY (Plymouth) questioned the accuracy of incidence rates in typhoid statistics and referred to the difficulty in diagnosing or even suspecting the mild cases that must so often occur in inoculated persons Dr W LEWIN (Johannesburg) asked whether when the new vaccine was introduced in India any controls were inoculated with the old Rawlings vaccine and the incidence rates compared Referring to Dr Brown's remarks he suggested that experience with alum precipitated toxoid in diphtheria prophylaxis, in which alum acted by delaying absorption were any guide, it might be better to inoculate whole bacterial bodies together with substances that delayed absorption rather than to use rapidly absorbed endotoxoid Dr D S SUTHERLAND (Manchester) questioned Colonel Boyd's comparison of figures from the South African and great wars and pointed out the differing sanitary conditions in the two cases Colonel E C HODGSON (Paignton) asked whether the comparison between T A B vaccine and endotoxoid in Dr Grasset's work was between the new virulent T A B or the old Rawlings vaccine

Colonel BOYD in reply said he was fully aware of the fallacies of great war statistics but did not think that diagnosis was either more or less efficient in the great war than in the South African War This fallacy was therefore a constant He thought that sanitary conditions during the great war were probably better than in the South African War but pointed out the big fall in typhoid incidence in the French Army in the great war following the introduction of typhoid vaccine There had not been much decrease in India in the mortality rate in recent years among those who did contract enteric This suggested that during the great war mild undiagnosed cases were probably not the result of prophylactic inoculation It had not been possible to compare at the same time persons inoculated with the new and with the old vaccines With regard to Dr Grasset's work he thought that until they were certain that a part of the antigenic complex of *B coli typhosum* was the equal of the whole for prophylaxis they would continue the use of suspension vaccines in the British Army

Dr GRASSET in reply to Colonel Hodgson, said that the T A B vaccine used before introduction of endotoxoid was prepared from a smooth recently isolated *Bact typhosum* In reply to Colonel Boyd, he said that comparative mouse immunization experiments with typhoid suspension vaccine and endotoxoid from the same strain showed a similar degree of protection when tested with a Vi typhoid strain

Glucose Tolerance in Obesity

Dr D EMBLETON, in a paper on glucose tolerance curves in 500 obese patients (242 males and 258 females) said that although the subjects were definitely obese no cases of gross endocrine disturbance were included The series probably did not represent a fair sampling of the obese population of the country, but all obese cases examined during the past fifteen years had been included about whom sufficient details were available The cases were mainly derived from the better-off classes A relatively small proportion only came because sugar had been found in the urine High glucose-tolerance curves were obtained in 73 per cent obese males but only in 35 per cent obese females at all ages The difference between males and females was still more marked when the percentages of high curves were charted for the various decades Superimposed high glucose tolerance curves of obese males showed that there was no marked difference between those with or without symptoms of diabetes The percentage of 'overweightness' did not appear to make any difference to the percentage of high glucose tolerance curves obtained in either sex

Dr S SILVERMAN (Birmingham) asked whether anything was known as to the nature of the disturbance of the fat metabolism in these cases Was there any constitutional tendency to obesity, and was it possible to treat such cases simply by controlling the calorie intake?

Dr EMBLETON in reply, said that fat metabolism was obviously bound up with the question, but he was not able to say exactly how The patients had a limited ability to deal with carbohydrate There was undoubtedly a constitutional factor, and some endocrine disturbance, possibly involving insulin production Anyone could reduce weight by starvation By putting them on a high protein diet and cutting out carbohydrate patients with a high tolerance curve could be reduced in weight

Treatment of Uterine Haemorrhage

With Dr RALSTON PATERSON (Manchester) the President of the Section in the chair, Mr B W WINDEYER in the absence of Mr C S Lane Roberts opened a discussion on the treatment of uterine haemorrhage

Mr Windeyer stressed the importance of preliminary diagnosis in cases of abnormal uterine haemorrhage emphasizing the necessity for pelvic examination to exclude malignant disease It was generally agreed that the action of rays in the treatment of non malignant uterine haemorrhage was confined to the ovaries in which the more mature follicles were highly radio sensitive In young subjects, in whom most of the follicles were immature higher dosage was required There was some evidence that radium in the uterus also had action on the endometrium In practice dosage received by the ovaries—between 500 and 1,000 r in most cases

should be sufficient to cause sterilization and this dosage was in fact usually followed by menopausal symptoms In cases of irregular haemorrhage at or about the menopause all the evidence showed that radiotherapy was the treatment of choice Preliminary dilatation and curettage were essential The mortality in a series of 7 000 cases quoted by Leonard Phillips was 0 25 per cent and the convalescent period was negligible The only contraindications were associated prolapse or cervical laceration and pelvic inflammation The former could be cured at the same time as the radiotherapy was carried out and the latter could be avoided by care in irradiation treatment Of fifty nine cases treated by him at a hospital Mr Windeyer said fifty seven were cured Fifty four of these were treated by radium in the form of a 50 mc tube with a screen of 1 5 mm of platinum for forty-eight hours The only complication of note was a watery uterine discharge due no doubt to local destruction of the endometrium by reason of the close contact of the radium tube As regards choice of method he was in favour of x radiation because of absence of complications because pelvic inflammation was not so dangerous and because it was possible in cases where anaesthesia was contraindicated In England the dosage was usually such as he had outlined In the U S A it was less and in France irradiation was given through the lateral vaginal fornices In the case of x rays many successful techniques had been described Mr Windeyer said that he used 200 kilovolts with a thoraeus filter and a focal skin distance of 50 cm Three fields 10 by 15 cm were treated and 300 *r* were given to each field on three occasions resulting in a dose of 700 to 900 *r* to the ovaries Menopausal symptoms did not differ from the natural or surgically produced climacteric In cases of fibroids radiotherapy was indicated in patients over 40 but contraindicated in young women unless the risks of surgery were too great The presence of pressure symptoms or of evidence of degeneration was also a contraindication In the case of menorrhagia in women under 35 hysterectomy had in the past been regarded as the method of choice There was however evidence to suggest that normal menstruation could be restored in a high percentage of cases and that the danger of abnormal children and monsters was small Treatment by *x* rays seemed the better method because of the absence of effect on the endometrium

Dr W M LEVITT read Mr Lane Roberts's paper Excessive uterine haemorrhage might be due to local pelvic causes to general causes to endocrine dysfunction or to over active ovarian function It could be dealt with by hormone therapy medication x rays and radium or by surgery In dealing with treatment by x rays and radium a very complete survey had been provided in 1933 and in 1938 by the discussions of the Radiological Section of the Royal Society of Medicine Thorough general examination should be carried out including blood count, bimanual examination and dilatation and curettage The advantages of x rays over radium were that the risk was *nil* there were no complications the results were better and there was no danger in cases of pelvic inflammation In addition hospitalization was not necessary and no anaesthetic need be given in cases where it was contraindicated Radium on the other hand was more suitable in cases where the red blood count was low cessation of haemorrhage was quicker and there was probably less destruction of ovarian tissue It was also cheaper and simpler and could be inserted on the occasion of dilatation and curettage Cases not suitable for irradiation required surgical treatment by either the abdominal or the vaginal route although the latter had a definite mortality Most fibroids called for surgical treatment but irradiation should be given to cases in which anaesthesia was contraindicated to patients over 40 in whom there were no signs of pressure and when the symptoms were mainly menorrhagia or irregular haemorrhage In cases of endometrioma irradiation might be the method of choice and should be given in castration dosage after exploratory laparotomy had confirmed the diagnosis Endometriomata in the recto vaginal septum—25 per cent of Dougal's cases occurred at this site—should be treated by irradiation Intractable menorrhagia in young women should only be treated by irradiation after hormone therapy and curettage had failed 150 to 200 mc hours should be given followed in three to six months by 500 mg hours In one series of cases normal menstruation had been restored in 88 per cent of cases

Miss BEATRICE M WILLMOTT (Birmingham) said that she performed abdominal hysterectomy in cases with pronounced chronic cervicitis with large fibroids causing symptoms or with submucous fibroids Curettage and medical treatment were indicated in women who desired children In all other cases she used radium x rays not being available A recent questionary sent to 226 patients treated for uterine haemorrhage at the Birmingham and Midland Hospital for Women showed that after radium treatment 94 per cent had complete amenorrhoea Only two patients complained of discharge under the heading Ill effects of treatment though 115 had some discharge for varying periods 7 per cent had pain lasting in some cases for three months Seventeen patients had menopausal symptoms three noticed increase in weight seven had headaches and fifteen complained of weakness and nerves Complete satisfaction with the result of treatment was expressed by 92 5 per cent The dosage in the 6 cases had been in the region of 2 000 mc hours with a screen of 1 mm of platinum the treatment period being from twenty four to forty eight hours Of 411 cases treated during the past four years there was no death due to radium treatment and the results had been very satisfactory

Dr F ELLIS (Sheffield) analysed the replies received from patients treated for uterine haemorrhage at the Jessop Hospital for Women Cases were classified into six groups the largest being those of benign uterine haemorrhage in which curettage had failed to reveal a cause and metropathia haemorrhagica Of seventy five patients who replied and who had had more than 1 800 mc hours all had amenorrhoea Of eight patients who had had less than 750 mg hours there were two failures both in women between 40 and 50 The dangers of preconceptional irradiation had not so far been adequately assessed Useful information might be acquired if uniform doses could be given to the whole endometrium without inactivating the ovaries In such circumstances menopausal symptoms might not occur

Dr LEVITT thought that the sterilization doses quoted by Mr Windeyer were higher than were necessary The large number of preliminary investigations advised by Mr Lane Roberts were he thought unnecessary in most cases He thought that pelvic sepsis could be lighted up by x rays He agreed with Mr Windeyer that even very large fibroids were in the absence of symptoms suitable for x ray treatment Sterilization should be carried out in cases of endometrioma Dr F ELLIS agreed with Dr Levitt that dosage lower than that urged by Mr Windeyer was sufficient

Dr R BOULTON MYLES (Worthing) said that it was often uneconomic to treat patients by x rays on nine consecutive days and he would be glad of a scheme whereby they could be treated on two or three days a week for two or three weeks

Dr R S MACHARDY (Southsea) said that occasional failures in the treatment of uterine haemorrhage were due he thought to varying positions of the ovaries He had usually spread x ray treatment over a period of three weeks and had found this better from the patient's point of view

Dr A CRAIG MOONEY (Plymouth) said that he had to treat patients in a single day because many of them travelled long distances and could not come daily He thought it possible that in cases of fibroids there was some irradiation effect on the uterus itself

Dr RALSTON PATERSON (Manchester) showed figures demonstrating the probable cause of failure in the treatment of nineteen out of 139 cases of uterine haemorrhage In three of these it seemed due to the low age of the patient in one to low dosage in five to overdosage and subsequent telangiectasia in two to intercurrent complications and in four to the fact that vaginal irradiation only was employed In two of the cases the diagnosis was doubtful and in two malignancy was discovered later

Mr WINDEYER in reply said that it was possible that he had been using higher dosage than was necessary but there had

been no ill effects He thought that the action of radiation was confined to the ovaries in cases of fibroids

Dr RALSTON PATERSON said that in the treatment of menopausal haemorrhage irradiation methods were evidently the best There was sometimes a difference of opinion about the efficacy of irradiation as against endocrine therapy Surely radiotherapy was in effect endocrinological in the sense that it acted on the ovaries and thus induced changes in the endocrine system In the treatment of uterine haemorrhage under the age of 40 and of fibroids however, the choice was between irradiation and surgery and depended on many factors of which the blood count and the results of curettage were the most important

SECTION OF PHARMACOLOGY

Thursday July 21

Teaching of Anaesthesia

With the President Professor A J CLARK (Edinburgh) in the chair Dr E FALKNER HILL (Manchester) opened a discussion on the teaching of anaesthesia

Dr Hill said that the student should be taught the fundamental principles upon which safe anaesthesia was based Administration of chloroform was valuable for instructional purposes because it required of the student concentrated attention and appreciation of slight changes in the patient's colour The interests of the student and the patient did not always coincide If the patient possessed a limited field of cardiac reserve the student's interests must be ignored and the safety of the patient made the anaesthetist's first concern He had safely administered light chloroform anaesthesia to 4,000 cases in an atmosphere rich in oxygen after premedication with atropine It had been shown that oxygen to a great extent protected the liver of animals anaesthetized with chloroform divinyl ether and diethyl ether and the breathing of an atmosphere containing only 15 per cent of oxygen was sufficient to induce degenerative hepatic changes

Dr J GILLIES (Edinburgh) said that advances in surgery had demanded increased mechanization of methods and increased skill on the part of the administrator There had been no commensurate increase however, in the facilities for the teaching of students The whole teaching of anaesthesia was at present inadequate and steps should be taken by the various medical schools to give more and detailed instruction and far more practice Co ordination between the pharmacologist research worker and clinician must be the basis of any wider schemes of instruction which might be formulated

Dr J URBAN HUMAN referring to the stages of anaesthesia stated that the third stage, in which operations were undertaken could be divided into four planes and 99 per cent of all operations could be performed in the first two planes This stage could also be regarded as consisting of an upper zone of muscular tone and a lower zone of muscular relaxation The character of respiration was a useful guide to the depth of anaesthesia but it did not help to distinguish between the upper and lower zones When the patient entered the third stage the pupils were contracted to almost pin point dimensions but they gradually dilated as anaesthesia proceeded The roving eyeball consisting either of a flickering lateral or a downward movement indicated that the patient was in the zone of muscular relaxation The corneal reflex should only be used in an emergency, but the chin reflex consisting of a downward movement of the thyroid cartilage and chin with each inspiration served to demarcate the zone of muscular tone from that of muscular relaxation

Dr J T HUNTER stated that a student should be taught to administer anaesthetics by the open method before graduating to more complicated methods In view of the exigencies of the operating theatre it was difficult for the practising anaesthetist to carry out research Mr JAMES RUSSELL (Glasgow) emphasized that the teaching of anaesthesia was largely a post operative problem He believed that the anaesthetist should be called into consultation before the anaesthetic Dr J K HASLER said that if the student was taught simple methods he would be able to teach himself more advanced ones His experience was that even advanced anaesthetists were often inexpert in simpler anaesthetic technique

In reply Dr HILL deprecated the use of cocaine in a nasopharyngeal spray preparatory to the introduction of an intratracheal tube, while Dr HUMAN stated that it was easy to pass the tube without the aid of local anaesthesia

Carbohydrate Metabolism in Anaesthesia

Dr C L G PRATT (Oxford) said that the administration of ether or chloroform was accompanied by various metabolic changes of which certain aspects of carbohydrate metabolism had lately received experimental attention The most striking of these was the hyperglycaemia produced by ether, acetylene ethylene and nitrous oxide all raised the blood sugar level to a lesser extent but in general the barbiturates and avertin were without effect in this connexion Many explanations had been offered as to the mechanism involved in the production of hyperglycaemia among them partial asphyxia augmentation in the release of adrenaline direct action upon the liver, and influence upon the action of insulin It was generally agreed that carbohydrate oxidation was the only oxidative metabolism carried on by nervous tissue, and this peculiarity rendered nervous tissue especially susceptible to any agent interfering with carbohydrate metabolism One hypothesis was that anaesthetic drugs produced anaesthesia by diminishing the amount of available acetylcholine as a result of cessation or diminution of carbohydrate oxidation, and so preventing the transmission of impulses at synapses in the central nervous system

The PRESIDENT remarked that if acetylcholine was concerned in anaesthesia one would expect atropine to be a good anaesthetic agent

Anaesthesia in Cardiac Surgery

Dr J K HASLER described the methods he employed to produce anaesthesia for operations designed to relieve cardiac ischaemia by attachment of omental grafts to the cardiac muscle The evening before the operation a draught of chloral and bromide was given, and one and a half hours before the operation an injection of omnopon and scopolamine Half an hour later 1½ grains of nembutal was administered and this was repeated after half an hour if the patient was not asleep General anaesthesia was induced with an ethyl chloride-ether sequence on an open mask and later this was replaced by a Tiegal Henle apparatus which administered a mixture of ether and oxygen The expired gases were conveyed to a tube dipping into water so that the desired degree of positive pressure could be secured Dr Hasler had not found it necessary to introduce an endotracheal tube It was unnecessary to use positive pressure until the pleural cavity was opened and the left lung collapsed when the metal tube was lowered into water for 5 or 6 c.m It was usually maintained in this position until the operation was completed but the pressure was increased during closure of the chest wall During the operation the patient was supplied with the maximum quantity of oxygen and the left lung was thus prevented from collapsing Occasionally gas would pass into the stomach, but this might be avoided by pressure upon the oesophagus

Dr FALKNER HILL said that Dr Hasler's paper illustrated the importance of avoiding anoxaemia He used morphine and atropine in preference to omnopon and scopolamine because the former combination was less depressant to the respiratory centre Dr J URBAN HUMAN stated that omnopon and scopolamine should be used in the proportion of 2/3 grain of the former to 1/150 grain of the latter Mr W ETHERINGTON WILSON (Torquay) expressed a preference for omnopon-scopolamine Dr J GILLIES (Edinburgh) inquired if the Tiegal-Henle apparatus was essential and if an intratracheal tube would make administration easier

Anæsthesia in Thoracic Surgery

Dr J T HUNTER said that in no other branch of surgery was the anæsthetist faced with such difficulties as in thoracic surgery. It was impossible to say that any one method was suitable for all operations; each case must be considered on its merits. The preparation of the patient was the same as for any other operation of any magnitude but in some cases a course of postural drainage was invaluable. Premedication should be of the lightest and no drug capable of appreciably diminishing the cough reflex should be employed. Drugs with a transient action such as sodium evipan and sodium pentothal were very valuable. High spinal analgesia had proved excellent for lobectomy and thoracoplasty. Bleeding was reduced to a minimum, the cough reflex was undisturbed and respiration was unimpeded. There was however a tendency to post-operative headache and there was a fall in blood pressure which could be treated by the use of ephedrine and other measures. Regarding general anæsthesia ether on account of its irritating effect and chloroform except in minute doses were unsuitable. Nitrous oxide was of considerable value but it was difficult to maintain a steady anæsthesia without using small quantities of chloroform or divinyl ether. Cyclopropane however seemed in spite of a few disadvantages to be very suitable for thoracic surgery. It could be given with a high percentage of oxygen. Respiratory movement was reduced to a minimum and it was easy to maintain a cough reflex.

Light in Relation to Climate and Health

With the President, Professor H. E. ROAF (Liverpool), in the chair, Dr W. R. G. ATKINS (Plymouth) opened the discussion on light in relation to climate and health.

Dr Atkins first presented some of the results of measurements of daylight—that is both sunlight and sky light—so that a discussion of the physiological effects proper might have a full quantitative background. His data showed that the energy in the anti-rachitic region of ultra-violet light (radiations of wave-length below 313 millimicrons) was a very small proportion of the total solar energy. The whole ultra-violet region even outside the earth's atmosphere contained only about 7 per cent. of that energy, whereas in the visible part of the spectrum there was 52 per cent. and in the infra-red 41 per cent. At the earth's surface the ultra-violet light was relatively much reduced. It was therefore advisable to consider the possible physiological importance of the remainder of the solar energy and the site of absorption of various wave-lengths. The deep red and short infra-red rays (about 0·7 to 1·4 microns) had the greatest power of penetration. Deep-seated heating resulting from their absorption was possibly responsible for the stimulation of the tissues. In heat stroke it was the mechanism of heat regulation of the body that was involved and it seemed likely that a well-sunned skin in which the blood capillaries were larger than in unexposed skins was better adapted for dealing with extremes of temperature. In England bright summer daylight might register up to 125 kilolux and in the Tropics up to 150 kilolux. Of light received during the year in Plymouth 1·5 per cent. was received in December and 15 to 18 per cent. during the brightest month which might be May, June or July. From three-quarters to four-fifths of the total light was received in the six summer months from April to September.

Dr V. F. SOOTHILL (Norwich), who followed, dealt with the problem as it appeared to a medical officer of health. He pointed out that a large body of people in this country worked without any daylight at all and asked if this were satisfactory. There was he stated a general consensus of opinion that some daylight was essential. He referred to certain experiments including those of Niels Finsen on anæmia, which supported that opinion but added that very little accurate scientific work had been done comparing the relative values of whole sunlight and of artificial illumination. Ordinary artificial illuminants showed an inadequacy at the blue end of the spectrum but more research was needed on the subject. The new Factories Act gave the Home Secretary power to lay down a standard of lighting for factories but no power was given in the Shops Act.

Dr J. V. A. SIMPSON (Torquay) said that it was only in the last two or three decades that the influence of sunlight on animal nutrition had been studied. The most biologically active rays were at a wave-length of about 300 μμ. Ultra-violet rays came from the sky as well as directly from the sun in addition the rays were reflected from the sea as he himself had proved at Torquay some ten years ago. The measurement of the rays had been carried out by the acetone-methylene blue gauge at Torquay for eleven years and the average range was from 1·5 units a day in winter to 14 units in summer. He showed coloured charts giving the daily meteorological readings throughout the year and revealing how much weaker was the winter sun in ultra-violet rays than was the summer sun. Even the winter sun on the south coast in clean atmospheres however was sufficient to prevent rickets in young rats and chickens. In spring there was a marked increase in effect owing to the greater power of the sun and the penetration of the shorter waves. Conversely it had been overwhelmingly demonstrated that the smoke screen of large towns with mist and fog stopped the passage of the rays and it was apparent that many parts of the country suffered from a serious deficiency of physiological light especially in winter. The effect of daylight was greatest when it followed darkness—for example in the early morning and in the spring. Darkness was essential to the success of light therapy. The wise use of these stimuli would continue to show excellent results but as Sir Leonard Hill had repeatedly emphasized there were other factors intermingled—for example the stimulating power of moving air on metabolism. It was for medical science to apply the knowledge now available and ensure the proper utilization of daylight in the promotion of public health.

Mr B. D. H. WATTERS's paper in his unavoidable absence was read by the President. This contribution to the discussion stressed the need for some dosimeter which would measure the quantity of ultra-violet energy actually received by the patient. The type of instrument required as well as the standard of measurement necessary to satisfy clinical demands were also discussed.

In the final paper before the subject was thrown open to general discussion Mr J. W. J. WALSH gave his views as an engineer. Regarding the daylight factor he wished on behalf of himself and Dr Paterson to disclaim any credit for the initiation of its use in order to express the natural lighting conditions in a building; actually it was first described by workers in Germany. The use of such a factor was necessitated by the great variability in the intensity of daylight. There were several types of instruments now on the market by means of which daylight factors could be quickly measured and they were being employed by public health departments in connexion with slum-clearance schemes and for other purposes. Dr Atkins had previously stated that situations with a daylight factor of 1 per cent. were adequately lighted but there were, Mr Walsh said, many rooms in which work was carried on where the daylight factor over by far the greater part of the working area was much less than 1 per cent. especially in the rooms on the lower stories of large office blocks. It was probably not too much to say that a large proportion of the urban population of this country spent the greater part of its days in conditions of daylight which for at least six to eight months of the year were miserably inadequate. While this might be more or less unavoidable in certain cases there was no excuse for it in many others. Modern methods of construction had made it comparatively easy to provide for more daylight than was possible twenty-five years ago.

Opening the general discussion Professor W. P. KENNEDY (Baghdad) cited clinical evidence showing the beneficial effect

... the partial exclusion of infectious cases had played an important part Segregation was rarely refused if the position was explained to the patient He stressed the value of adequate nutrition the need to abolish bovine tuberculosis in this country and the importance of detecting the original source of infection in a family He did not believe in the value of the examination of child contacts

Dr G S TODD (Midhurst) pointed out the inadequacy of the teaching of undergraduates so far as pulmonary tuberculosis was concerned It should be compulsory for them to spend three months in a chest hospital so as to familiarize themselves with the various aspects of the disease Only too often had patients been seen with symptoms suggestive of pulmonary tuberculosis months before they eventually reached the sanatorium He deprecated the use of the term tuberculosis dispensary , to call such a dispensary a chest clinic would encourage more people to attend The public should be educated to the belief that tuberculosis was a curable disease

Dr G JESSEL (Leigh, Lancs) believed that the training of undergraduates in tuberculosis was adequate, at least in some places He was surprised that Professor Dunlop had not referred to the importance of radiography in the prevention of tuberculosis Dr JAMES CROCKET (Glasgow) thought that too much stress had been laid on the epidemiology of tuberculosis The death rate from this disease had fallen because of improved conditions of living and because of the progress made for dealing with the disease Much could yet be done to decrease the incidence and mortality of tuberculosis by prompt and thorough action In his experience, when a new case of pulmonary tuberculosis was notified anything from six to twelve weeks elapsed before the local authority could deal with the case, and during that time the patient went progressively down hill

Dr F J H COUTTS (Bournemouth) said that much more education of both the public and the medical profession was needed The general practitioner was often to blame for not applying simple measures for the diagnosis of pulmonary tuberculosis Dr A NEVILLE COX (Brighton) referred to the effect of war conditions on the mortality from tuberculosis and to the fact that pulmonary tuberculosis was often quite symptomless in the early stages

Dr GREGORY KAYNE (Staines) said that exogenous re-infection was possible—at all events when the dose was massive—as was shown by a case recently recorded A medical man whose tuberculin test was known to be positive attempted to commit suicide by injecting into himself a culture of virulent tubercle bacilli , in a very short time he died from generalized tuberculosis It had now been shown that B C G was inoffensive but its protective effect was limited In certain circumstances its administration even in this country would be of value in individual cases The removal of children from households in which they were exposed to the danger of infection should be necessary only for short periods, and was he thought practicable The examination of child contacts was of great value if performed properly it should include Mantoux testing the taking of antero-posterior and lateral radiographs and an examination of the gastric contents in suspicious cases

Black Spots in Tuberculosis Distribution

Dr F J H COUTTS (Bournemouth) opened a discussion on black spots in tuberculosis distribution He indicated the regions of high mortality and discussed in some detail such factors as race occupation (with special reference to seafaring) housing and sanitary conditions overcrowding segregation and migration For practical purposes the racial factor should be ignored in considering measures to be taken against tuberculosis He laid stress on the improvement of housing and sanitary accommodation and above all on a stricter insistence on the segregation of infective cases

Dr D A POWELL (Cardiff) said that the whole of Wales was in a sense a black spot compared with England or Scotland which themselves were black spots when compared with Holland, Denmark New Zealand, and Canada In the

... of health staff ... relating to underground train ... drivers on the other To ... hand and trim drivers the difficulties encountered ... replied stating ... one obstacle Professor ... mentioning the shift system as ... whether the sensitivity ... BLOCKLEHURST (Bristol) inquired ... light individuals increased after they had been in dark-... and also spoke of the effect of exposure to strong winds ... being capable of pigmenting the skin in spite of low ... illumination Dr L H N COOLER (Plymouth) related a personal experience in Norway where on a cloudy day with no sun he rapidly acquired a deep sunburn

In his final reply Dr ATKINS said that one of the objects of his paper was to take attention away from ultra-violet light and direct it to the spectrum as a whole and also to create interest in tropical physiology In regard to the influence of light there were two effects (1) erythema production and (2) the enlargement of the capillaries which could persist for quite a long time He thought gradual training could permanently enlarge the capillaries and thereby alter the whole blood supply to the skin

SECTION OF TUBERCULOSIS

Prevention of Tuberculosis

With Dr ERNEST WARD the President in the chair Professor D M DUNLOP (Edinburgh) opened a discussion on modern views on the prevention of tuberculosis

Professor Dunlop, referring to the factors that might account for the falling mortality from tuberculosis mentioned particularly the possible existence of epidemic waves and the part played by anti-tuberculosis measures There was no reason to believe that an epidemiological curve could not be modified beneficially by human effort He thought that adult tuberculosis usually occurred as a late visceral manifestation of an earlier disease Efforts should be directed, therefore, to the prevention of massive primary infection in the young child These endeavours he maintained must be directed along two main channels children must be prevented from coming into close contact with cases of open tuberculosis and a clean milk supply must be provided As to the first of these it was probably more satisfactory to remove and treat the adult patient who was the potential source of infection More beds for this purpose were urgently needed It was doubtful if any physician in the public health service did his duty adequately unless he was being a continual nuisance to his committee in this respect Raising the resistance of the individual by improving certain environmental conditions was important in prevention as was the adequate training of future practitioners in the diagnosis of early tuberculosis He concluded by saying that some authorities had stressed the difficulty and impracticability of examining contacts while others claimed that these examinations in the widest sense were among the most important functions of the tuberculosis dispensary with the latter view he could not too strongly agree

Dr ERNEST WARD the President thought that up to 1915 the fall in the mortality from tuberculosis was due not to anti-tuberculosis measures but mainly to general public health measures and the improved standard of living since 1915

age group from 15 to 25 years 33 per cent of the deaths among males and 53 per cent of those among females were due to tuberculosis The corresponding proportions for those persons between 25 and 35 were 31 and 38 per cent A high mortality among young adults was however also found in other countries In the last twenty five years there had been a decline of 50 per cent in the mortality from tuberculosis in Wales this fall was much less than in England or Scotland The three main occupations of the people of Wales —coal mining (especially of anthracite) quarrying and sea farming—brought added risks Other factors were depopulation and the intense conservatism of the social and domestic habits and the closeness and tenacity of the family relationships in Wales He did not think that the racial factor played any part but poverty was certainly of prime importance

Dr C ROLLESTON (Rutland) asked what was the part played by alcoholism in the problem under discussion Dr COUTTS in his reply considered that alcohol was not of much importance Dr POWELL said that alcoholism was almost non existent in Wales

SECTION OF OPHTHALMOLOGY

Thursday July 21

Co-operation in Cases of Visual Loss

With Sir STEWART DUKE ELDER in the chair Mr C B F TIVY (Plymouth) opened a discussion on co operation between ophthalmologist and physician in certain cases of visual loss He said that the ophthalmologist was sometimes the first to see signs of established general disease not because others had overlooked them but because patients considered eye symptoms as a separate entity from other bodily symptoms and also because the ophthalmoscope might clearly reveal lesions that elsewhere could only be inferred—for example eye changes in chronic nephritis diabetes and hyperpiesis A number of unsolved problems arose in this connexion such as the clinical fact that there was no parallelism between changes in the fundus and the severity of hyperpiesis A similar difficulty was seen in a recurrent vitreous haemorrhage which occurred in apparently healthy young adults Mr TIVY referred to the good that could be done by rest in cases of thrombosis of a branch of a retinal vein and the diagnostic significance to be attached to diplopia from paralysis of the external rectus in hyperpiesis A study of field defects was most helpful in localizing cerebral lesions and in ascertaining progress while ocular lesions in apparently healed cases of head injury might show the true state of affairs Collaboration was possible in other directions in his experience at least two cases of neurasthenia were relieved by a timely operation for cataract

Dr E MCCULLOCH (Plymouth) said a better understanding of eye diseases by general practitioners was essential if unqualified practice in eye work was to diminish He instanced cases where the time factor was important as showing the need for collaboration

Professor J A NIXON (Bristol) drew attention to the value of perimetry in diagnosis and emphasized the disturbances caused by vitamin deficiency In vitamin A deficiency there was diminished dark adaptation in vitamin B_1 deficiency—for example in beriberi—retinal haemorrhages were present while acute glaucoma had been described in epidemic dropsy Collaboration between ophthalmologist and physician was most helpful in the toxic amblyopias Dr C M HINDS HOWELL discussed a number of neurological conditions particularly chiasmal syndromes caused by localized arachnoiditis Other subjects he discussed were the visual symptoms of tumours of the occipital lobe recovered meningitis with secondary optic atrophy amaurotic familial idiocy Schilder's disease and cataract in dystrophia myotonica Dr R N CRAIG (Exeter) held that it was not because the psychiatrist overlooked the significance of such an essential function as vision that he saw so small a number of patients with serious eye trouble The fact was that the blind rapidly adapted themselves In contrast with the deaf who become isolated, the blind received much sympathy Functional blindness was a defence mechanism against exquisitely painful memories of events associated with seeing and this blindness was generally associated with amnesia

In the subsequent discussion Professor A J BALLANTYNE (Glasgow) emphasized the tuberculous character of at least some cases of recurrent vitreous haemorrhage and pointed out the lack of knowledge on the aetiology of hypertensive retinitis Mr RANSOM PICKARD (Exeter) instanced a case of unilocular retrobulbar neuritis which after thirty years showed no signs of disseminated sclerosis He also related that Nettleship held that a patient who became completely deaf became as placid as one who was completely blind Mr R L BICKERTON drew attention to the pitfalls in the diagnosis of migraine especially in relation to cerebral tumours Dr R M MOORE (California) quoted American work indicating a deficiency of vitamin B and of calcium in a high proportion of patients suffering from eye and ear nose and throat affections

SECTION OF OBSTETRICS

Wednesday July 20

The Obstetrical 'Flying Squad'

In a paper on the organization and uses of the obstetrical *flying squad* *Professor E FARQUHAR MURRAY* said that the squad which was now an essential part of a modern maternity service was especially designed to deal with those acute crises that might occur in the most carefully supervised cases Cases most urgently in need of such a service were those in which there was shock and post partum or ante partum haemorrhage but cases of threatened or actual eclampsia difficult labour or failed forceps would also derive benefit A doctor faced with an emergency sent a message to the maternity hospital giving particulars of the case and the name of the consultant on the panel whom he wished to attend Since the inception of the service in October 1935 there had been forty six calls Among these were many very ill and dying women and yet there had been only five deaths No major operative work was carried out at the patient's home if this could be avoided Saline and blood transfusions simple bipolar version repair of any badly torn perineum etc were performed

Discussing blood transfusion in obstetrics Dr M BLACK (Glasgow) said that the difficulty of securing recipient's serum had been overcome by the use of a special cylinder and piston designed by him in collaboration with Dr Sheehan A small quantity of the patient's blood was placed in the cylinder and a strong piston was screwed down and the blood squeezed against a Zeitz K filter the serum was collected from the end of the cylinder With this apparatus enough serum for testing against the red cells of several prospective donors could be obtained within a few minutes From 600 to 1 000 c.cm of blood were usually given over a period of fifteen to twenty minutes The administration of a few drops of ether on an open mask at the beginning of a transfusion served to keep the patient quiet and had a useful stimulant effect

Miss LETITIA FAIRFIELD congratulated Professor Farquhar Murray on the excellent results of his emergency unit It was pointed out that the high degree of efficiency of the L C C ambulance services had not made the introduction of the emergency unit in London so pressing There were however such units now in existence in the L C C area

Reports of Societies

NUTRITIONAL MACROCYTIC ANAEMIA IN MACEDONIA

At the annual general meeting of the Royal Society of Tropical Medicine and Hygiene, with the president, Lieutenant-Colonel S P JAMES in the chair, a conjoint paper on nutritional macrocytic anaemia in Macedonia was read by Dr N HAMILTON FAIRLEY

Dr Hamilton Fairley pointed out that in a paper read in association with R J Bromfield before the Society last year the prevalence in Macedonia of tropical macrocytic anaemia was recorded in pregnancy as well as in male patients with malaria and blackwater fever (*Journal*, 1937 1 629) As this was the first time that a megalocytic anaemia of nutritional origin had been reported on a large scale in Europe they had returned to Macedonia early this year to study the situation in more detail in conjunction with Mr Henry Foy and Dr Athena Kondi at the League of Nations Malaria Research Laboratory, Thessaloniki The present preliminary report was the outcome of their combined efforts to get a clearer insight into the megalocytic anaemias there

General Considerations

The patients were mainly Greek refugees from Asia Minor, some 700,000 of whom had been settled in villages scattered throughout the plains and mountainous regions of Macedonia Macedonia was an intensely malarious country with a 'spleen rate approximating to 40 per cent and varying from 70 to 90 per cent in some of the villages from which the patients came In the refugee villages poverty was rife meat, eggs and milk were little eaten and the diet generally was very deficient in sources of animal protein as judged by European standards

Though the syndrome commonly encountered in Macedonia was similar to that previously described by Fairley Giglioli, and Napier in tropical patients, difficulty was experienced in naming it In the first place, the term 'tropical' seemed hardly applicable to a disease originating on a large scale in Europe In the second place though they were satisfied that the anaemia had a nutritional basis, certain features generally present such as splenomegaly and reticulocytosis and such evidence of haemolysis as hyperbilirubinaemia urobilinuria and bilious stools were absent in uncomplicated tropical macrocytic anaemia as described by Wills in man, or in the experimentally induced deficiency in monkeys In their present Macedonian series three types of macrocytic anaemia had been recognized (1) haemolytic, (2) non haemolytic (3) aplastic For the reasons given above they proposed substituting for the name tropical macrocytic anaemia that of nutritional macrocytic anaemia —a term which would include as subgroups the common haemolytic type the infrequent non-haemolytic type and possibly the rare aplastic type as well Microcytic hypochromic anaemia—so common in pregnant women in India—was only once encountered, and in this case there had been a severe post-partum haemorrhage some three weeks previously

Clinical Findings

The clinical picture in the haemolytic type was striking and resulted from a combination of factors including (1) panmyelopathy with megalocytic anaemia and its attendant symptoms (2) haemolysis associated with splenomegaly (3) mechanical disturbances caused by visceral enlargement and (4) cardiac decompensation

Though anaemia was intense and haemolytic icterus often evident the general nutrition was unexpectedly good the nails and teeth being excellent and the usual lingual features absent The uterus as it extended upwards was often displaced to the right by the enlarged hard spleen while the liver was not infrequently enlarged and tender from congestive failure Pressure effects on the diaphragm were sometimes evident

Subjective symptoms included lassitude, weakness aching muscles, shortness of breath palpitations, giddiness, and syncopal attacks Anorexia, epigastric discomfort abdominal pain and flatulence after meals were common Free acid was generally present, and in twenty consecutive cases the gastric juice showed the presence of hydrochloric acid following histamine injection Diarrhoea was rare and, in contradistinction to sprue the glucose tolerance and faecal fat were both normal Dyspnoea and cough were frequent and upward displacement of the diaphragm tended to compress the base of the lungs The apex beat was occasionally displaced upward and at times the right heart was obviously dilated Signs of decompensation included jugular engorgement and pulsation enlargement and congestion of the liver, basal rales, and oedema of the feet and dependent parts Albuminuria was not uncommon but casts were rarely found Urobilinuria was the rule and the blood urea was commonly elevated due probably to blood destruction rather than to urea retention No definite evidence of subacute combined degeneration of the cord or neuritis was forthcoming

Not uncommon was a secondary thrombocytopenic purpura manifested by skin haemorrhages bleeding from the nose and gums and sometimes from the other mucous membranes as well The platelet counts in these cases varied from 5 400 to 54,300 per c mm

Haematological Findings

The blood picture was that of a megalocytic anaemia with increased mean corpuscular volume increased mean corpuscular haemoglobin and a colour index equal to or exceeding 1 0 In these profound anaemias blood films fixed and stained with Jenner's stain often proved unsuitable for Price Jones measurements owing to rouleaux formation and excessive shrinkage of the erythrocytes With Leishman staining (when fixation with methyl alcohol was of shorter duration) the shrinkage was often less and in a number of instances typical megalocytic curves were obtained Normoblasts and erythroblasts often appeared in peripheral blood smears Smears from the sternal marrow showed considerable hyperplasia of the red cell series, haemocytoblasts and erythroblasts being generally present in large numbers Ehrlich megaloblasts were demonstrable in most cases but it was rare for their cytoplasm to have ripened beyond the polychromatic stage and it never stained a decisive pink A striking feature was the presence of atypical cells of the neutrophilic series including pathological promyelocytes myelocytes and metamyelocytes

The changes observed included precocious nuclear polymorphism atypical granulation of the cytoplasm cytoplasmic vacuolation and perforation of the nucleus The large pathologically altered stab forms described by Tempka and Braun in pernicious anaemia were often evident Megalocytic nuclei devoid of cytoplasm were not infrequent a finding suggesting that these cells were also affected The conclusion reached was that in nutritional macrocytic anaemia there was a panmyelopathy of the bone marrow similar to that recently described in pernicious anaemia

Conclusions

Both clinical and pathological findings pointed to chronic malarial infection in these cases On the other hand during the time they were under observation fever of malarial origin was infrequent and parasites were rarely found in the peripheral blood or sternal marrow smears In cases coming to necropsy the characteristic features of chronic malaria were observed Active hypertrophy and increased phagocytic activity of the reticulo endothelial elements were very evident in sections of the liver and spleen in two cases studied by Professor G R Cameron malaria pigment and haemosiderin were also present

The conclusion reached was that nutritional disturbances in the bone marrow led to the production of red cells which were somewhat abnormal and that the reticulo-endothelial system already hypertrophied as a result of chronic malaria phagocytosed these non-parasitized corpuscles with the production of a superadded haemolytic anaemia. All available data—clinical pathological haematological and biochemical—supported such a thesis.

Time did not permit full consideration of the haematological response to therapy but in general it might be said that during pregnancy both marmite orally and liver extract by injection had to be given in a much larger dosage than was customary in tropical microcytic anaemia in India to get a maximal reticulocytosis even when this was attained subsequent increase in the red cell count was slow. This was probably due to the haemolytic factor which complicated dietary deficiency in the vast majority of the Macedonian cases.

General Discussion

Dr LUCY WILLS in opening the discussion said that her work had been confined to the uncomplicated disease generally known as tropical macrocytic anaemia but she agreed that in future it might with advantage be called nutritional macrocytic anaemia as Dr Fairley and his colleagues suggested and that the name tropical macrocytic anaemia should be abandoned or be used only for tropical cases as a subsection of the general heading. She had met cases similar to the Macedonian ones in India but had provisionally regarded them as cases of *acholuric* jaundice and unsuitable for therapeutic testing. She also had seen some of the Macedonian cases and was inclined to accept the view put forward that there was a nutritional factor and also a haemolytic factor dependent on reticulo-endothelial hypertrophy resulting *from chronic malaria. The amount of liver and marmite* required to induce a reticulocyte response and also the small rise in the red cell count suggested that all the Macedonian cases were complicated. It also had to be remembered that the curative factor both in these Macedonian cases and in the tropical ones seen in Bombay might not be liver principle pure and simple but some other factor distinct from liver. Her experience in regard to Price Jones curves agreed with that of Dr Fairley. Some preliminary experiments suggested that dilution of blood in the presence of an excess of bilirubin might cause shrinkage of the cells on a smear but not *in vivo*.

Dr JANET VAUGHAN said she was not prepared to accept the suggestion that the discrepancy between mean corpuscular volume and corpuscular measurement was due to an artefact or some abnormality dependent on the method of staining since it was known in acholuric jaundice and had also been seen in mild anaemias in pregnancy where it was associated with increased cell thickness and increased fragility. The remarkable variation in the picture of marrow obtained by sternal puncture described by Dr Fairley was also seen in cases with Addisonian anaemia and many showed as definite a disturbance of white cell maturation as of red cell maturation—in this way resembling nutritional macrocytic anaemia. Addisonian *pernicious anaemia however did not exhibit* the purpuric manifestations described by Dr Fairley. She inquired whether the diet in Macedonia was deficient in vitamin C.

Professor L. E. NAPIER said he had been doing very much the same type of work in India and had just compiled an analysis of fifty-seven cases of anaemia in pregnancy. His series included a large group of microcytic anaemias. The whole population had a microcytic blood picture and those films which elsewhere might be termed normocytic were really macrocytic. Some factor existed which decreased the size of cells in the entire population. The microcytic anaemia was due to dietetic deficiency or to ankylostomiasis the macrocytic anaemia to dietary deficiency and/or malaria. In the latter respect his conclusions were very much the same as those of Dr Fairley. In regard to the suggestion of alteration in nomenclature he considered Macedonia was subtropical and thought that in the present state of knowledge the name tropical macrocytic anaemia should stand.

Dr G. FRASER pointed out that these severe and complicated anaemias were common among labour forces on tea estates in Assam. These patients suffered from dietary deficiency malaria and hookworm but he did not consider hookworm to be more than a minor contributory factor. The majority of cases came from malarious estates with a spleen rate of 30 per cent. or more and practically none came from estates with a spleen rate below 10 per cent. Treatment was on the whole unsuccessful marmite treatment in doses of 24 grammes daily was disappointing in late cases and campolon even in doses of 5 c.cm. daily for ten days often failed. In cases after the seventh month of pregnancy with counts of under 1,000,000 red cells per c.mm. the position was desperate but a better response might be obtained with the larger doses adopted by Dr Fairley. In such cases blood transfusion was liable to be followed by grave reactions and induction of labour to prove fatal on account of shock.

In reply both Dr Fairley and Dr Wills pointed out that stained smears from male patients with nutritional macrocytic anaemia showed the same difficulty in regard to Price Jones measurements. Dr Fairley said he was very interested in what Dr Vaughan had said in regard to increased fragility. They had failed to demonstrate increased fragility of the red cells by qualitative methods in six cases in their series of nutritional macrocytic anaemia. He agreed however that the red cells were abnormal and thought that more delicate quantitative methods might yet reveal increased fragility. So far as could be ascertained there was no evidence of vitamin C deficiency in the diets of patients developing purpura and the condition was invariably associated with very low platelet counts.

Correspondence

Abortion and the Law

SIR,—Most of your readers who have studied the report of the case to which you refer in the leading article entitled Therapeutic Abortion and the Law will probably agree that the issue of widest importance to our profession is the interpretation given in the case to the expressions danger to life and preserving life and this irrespective of any views they may hold of the initial event which led to this interpretation receiving the sanction of the law.

In commenting upon the result of the trial you Sir express the view that the law has been clarified from which it seems reasonable to conclude that you regard these two expressions as having been given greater clarity and definition than they formerly possessed, and the practitioner as having attained in consequence some measure of freedom and security in a certain respect that he did not previously enjoy under the law. I venture to submit that a logical case may be made out for the view that nothing has in fact been clarified and that so far from receiving any advantage from this interpretation those who practise medicine in this country must now be less certain of what protection they may expect from the law in any given case than they were before it was sanctioned.

In considering this question it is essential to dismiss all irrelevant factors and of these the factor of rape is certainly one for the verdict did not give the right to induce abortion for pregnancy ensuing upon ravishment nor did Mr Bourne ask for this. The point upon which the case hung was clearly the meaning to be attached to the expression danger to life. Now this expression has never been and of its nature can never be capable of exact definition. At most it can but connote that order

of moral certainty that is all we can look for in medical assessments But at any rate men could agree about its meaning even if it left the precise expectation of the life of the imperilled person a matter of some uncertainty Perhaps the associated expression "preserving life possessed an even higher degree of literalness in ordinary use whether by doctors or laymen

A study of the case report makes it clear that there was nothing literal in the interpretation of these terms accepted during the hearing or by the jury at its end In the course of this hearing the judge expressed himself as unable to appreciate any essential difference between danger to health and danger to life and then proceeded to cite an instance where health was impaired but life not threatened But this is to admit that there may upon occasion be a profound difference between the two In other words to the aphorism "life depends upon health the inference that danger to health necessarily connotes danger to life is a *non sequitur* Indeed, has not the native wit of our ancestors embodied the general recognition of the fact in the old saying that "creaking gates hang the longest ?

Thus it is that the generalization that there is no clear difference between danger to health and danger to life is not one that can be regarded as useful to the doctor who in his practice has to deal not with categories but with individual sick persons For the doctor then, it is reasonable to hold that nothing has been clarified by this exegesis of the expression "danger to life, though it appears that he may in future be expected to make it a basis of action But this is not all, for not only has danger to health been accepted as the equivalent of danger to life but two modes of health—physical and psychological—are now proposed to us as capable of being separately endangered that is to say 'life is now threatened from two quarters In short psychological ill health may now be equated with danger to life It follows that the expression preserving life has suffered a proportionate loss of definition for it may now be lawfully taken to mean no more than the averting of a possible (and problematical) neurosis So far have we already travelled from reality!

Now if the expression danger to life in its old literalness lacked the highest degree of exactness and lacked this because the art of prognosis is beset with uncertainties how much less exact has it now become! The intellectually candid doctor will admit that forecasts of psychological health are highly speculative In this as yet imperfectly won field of medical knowledge such forecasts cannot be invested with any known or measurable degree of probability and the candid doctor will be cautious in making them, knowing as he does the ever-present danger of self deception, of exaggeration and even of gross error In short when we come to equate danger to life with danger to psychological health we see that the former term has already become a pure figure of speech and has ceased to be an element in the grammar of medicine Surely to speak of this as clarifying anything is to be deceived by a play on words Some may indeed hold that legal sanction for the induction of abortion with a view to averting the development of a psychoneurosis is a good thing but to maintain that this is equivalent in sense to the judge's ruling that the unborn child must not be destroyed except for the purpose of preserving the life more precious life of the mother is a feat of ratiocination that I confess to finding quite beyond my powers Yet this is what the verdict does in fact permit a doctor to maintain

While the two debated expressions do not belong solely to the grammar of medicine yet they are familiar elements in that grammar, and it is plainly desirable that—as with all other elements in any scientific or technical grammar—they should possess as clear meaning as we can give them Can we now say, either as scientists or as practitioners of the art of medicine, that the new, extended, and virtually indefinable meanings now given them really enhance their value to us? Has this legal interpretation rendered them more comprehensible elements in our medical grammar, or has it conferred upon us as practitioners a measure of secure freedom we did not previously enjoy?

I submit that the answer to both these questions is plainly in the negative, and in respect of the second question it would be easy to emphasize the difficulties and uncertainties that now surround the problem you suppose to have been clarified

However, I am anxious not to stray beyond my modest purpose of a defence of clarity and precision in medical terminology—that is, a defence of clear thinking in medicine and a protest against the thesis implicit in your article that facts may be altered by using different words about them If it be said that all this is to make of a live issue a mere matter of words I may reply that if the words we use have no discoverable and definite meaning we cannot think clearly or act reasonably At a first glance the law, by this verdict may seem to have conferred upon us an enlarged measure of freedom, but, as one who believes that medical terminology may be more safely interpreted by doctors than by lawyers I profoundly distrust this similitude of freedom, and with Laocoon—than whom I hope I may be more fortunate in my intervention against popular opinion—I say 'timeo Danaos, et dona ferentes'—I am, etc,

London W 1, July 30 F M R WALSHE

Cancer of the Lung

SIR—It is with some diffidence that I criticize your excellent leading article on cancer of the lung in the *Journal* of July 23 (p 184), but the statement 'The usual operation is lobectomy, or even total pneumonectomy," cannot be allowed to pass unchallenged It suggests that lobectomy is the operation of choice in carcinoma of the lung, if such a belief is maintained and practised the results can only lead to disappointment and hold up the progress of thoracic surgery

It is very rare to find a malignant growth of the lung which is technically amenable to lobectomy, even if it were desirable It is just as important to plan a radical operation for carcinoma of the lung as it is for malignant growths elsewhere in the body The lymphatic communication between the lobes and at the hilus makes total pneumonectomy with individual ligation of the vessels and closure of the main bronchus near the bifurcation of the trachea the only radical procedure

Until some more rational treatment of cancer is established this is the only form of attack on cancer of the lung that can be claimed to be anything better than palliative With modern improved methods of diagnosis and operative technique there is no reason why the results of surgery for carcinoma of the lung should not be at least as successful as those in carcinoma of the stomach which is admittedly a poor standard to set and bears no particular justification for professional pride—I am etc,

London, W 1, July 29 VERNON C THOMPSON

Injection Risks—A Case of Gas-gangrene

SIR,—Your annotation of April 30 (p. 955) on injection risks so impressed me that I issued a circular to all the hospitals and dispensaries under me warning them of the danger of using hypodermic syringes that had been kept or even sterilized in alcohol but admitting that in practice I did not see how they could boil every syringe for ten minutes in 3 per cent. sodium bicarbonate lotion and certainly autoclaving is out of the question. Before reading your article I regret I was not aware of the danger referred to but have now had it brought home to me most vividly.

On June 16 a feeble man of 50 years 5 ft. 5 in. in height but only 6 st. 13 lb. in weight was admitted to the Windham Hospital in Jodhpur for dysuria. His blood pressure was 100/60, blood urea .20 mg., urine urea 2 per cent., Hb. 75 per cent., and indigo-carmine excretion from the right ureteric orifice below 50 per cent. of normal but excellent from the left side. As the bladder was slightly infected he was at one time submitted to ureteric catheterization and as straight x rays were conclusive there was no need to expend uro-electan on him.

The diagnosis was a phosphatic bladder stone and a stone in the right kidney. A two-stage operation was decided on and so his bladder stone was crushed under a caudal block anæsthesia on June 20. His condition improved after this and on July 1 under ether I did a right nephrectomy, the kidney not being worth saving. The operation was unusually easy and the next day his condition was as good as one could expect. He was on a four-hourly injection of atropine and strychnine because he was still rather feeble.

On July 3 in the early morning he was very ill but by middle day he was complaining of pain in the right arm (triceps region) where some at least of the injections had been given and his pulse had shot up from 86 to 126 and his temperature to 100·6. Locally there was tenderness but nothing else of note. He was treated as a case of abscess following hypodermic injection. The same evening however the condition was obviously one of gas-gangrene and by 7 p.m. he was having injections of serum intravenously, intramuscularly and locally. He refused operation and despite all other efforts died on the morning of July 5.

The cause of the infection must certainly be attributed to an injection. Whether that was the one given by the theatre staff before operation or one of the many in the ward could not be traced as the doctor who first diagnosed the case at once had everything that could possibly be infected either destroyed or properly sterilized and all the others of the fifty-two surgical cases in the ward who had had injections which might have been from the same syringe, were given prophylactic doses of serum and no other case has occurred. Satisfactory though this has been from the point of view of the patients it has prevented me from ascertaining the source of the infection.

According to your article there are two factors to be considered—the syringe and the patient. In this country owing to shortage of staff and equipment and the conditions under which work must be done in the villages the syringe must always remain a potential source of danger. It cannot be autoclaved as a routine even in the biggest hospitals I imagine, while in district hospitals and dispensaries boiling for ten minutes is scarcely likely to be done, and on many occasions I know I have in the past given and in the future shall have to give injections in mud huts in far away villages with a sandstorm blowing from a syringe which can only possibly be sterilized by alcohol.

My patient who died was in a bed to which access was easier to the right side than the left, so he may have had most of his injections in the right arm. But what a prospect—a man stands a nephrectomy well but cannot resist perhaps a dozen hypodermic injections! In future I have arranged for all four hourly and six hourly injections to be given in alternate arms the site of each being duly recorded in writing but this of course is possible only in the Windham Hospital and not in smaller hospitals and dispensaries throughout the State where fortunately injections are given less frequently. If however one could guarantee the sterility of syringes this extra work for the nursing staff could be avoided.

Can any of your readers suggest a feasible method of syringe sterilization for adoption where boiling is impracticable? What acids do Coulthard and Sykes recommend where can I see their paper and is subsequent washing out with sterile water necessary? A case like my recent one may occur once only in a million injections but that does not lessen the disappointment at losing a life after a clean operation.—I am, etc.

Jodhpur, India, July 13. E. W. HAYWARD.

The reference to the article mentioned in the last paragraph is COULTHARD, C. E., and SYKES, G. (1936) *Pharmaceut. J.* **137**, 79.—ED., *B.M.J.*

Sulphanilamide for Meningococcal Meningitis

SIR,—My medical experience includes two outbreaks of meningococcal infection at Catterick Camp, Yorkshire, during the period 1930 to 1933. I therefore read the article by Drs. T. C. Morton and J. D. Ebsworth on sulphanilamide therapy in meningococcal meningitis in the *Journal* of June 25 (p. 1362) with considerable interest. The three cases reported suggest the type of case seen in an established outbreak. In my experience serum therapy gives a reasonable recovery rate in these cases.

The fulminating sporadic type of this disease is however a much more severe test of a new therapy. During the last six months I have encountered two such cases. One was that of an English officer with a generalized hæmorrhagic rash. Serum and prontosil soluble (Bayer) were used freely but death followed the infection in six days from the onset. The second case was under my care when the *Journal* of June 25 reached me. An English soldier had a few petechiæ in the skin of his abdominal wall and a temperature of 105° F. he complained of pain below his left costal margin, the clinical picture suggesting an attack of primary malignant malaria. Next day his neck was painful and lumbar puncture gave scanty semi-digested polymorphonuclear cells and a few meningococci. He was treated with serum and solusepta-sine (May and Baker). Death occurred on the eighth day of his illness. In each case meningococci were demonstrated in the cerebrospinal fluid at an early stage in the illness. A sulphanilamide preparation was used freely but did not appear to influence the progress of the infection to a fatal conclusion.—I am, etc.,

F. J. O'MEARA, M.D., F.R.C.P.I.

British Military Hospital, Ramkhet, U.P., India, July 22.

Ischio-pubic Osteochondritis

SIR,—My note in the *Journal* of June 18 (p. 1309) has had the desired effect of drawing attention to this interesting condition. As suggested in my note the condition is evidently not so rare as the published cases would lead

one to infer Mr H A T Fairbank (July 16, p 148) has made a valuable contribution to the subject, but I think that his figures are probably too high Any degree of thickening, irrespective of rarefaction, at the ischio pubic area is apparently included, and the radiographs examined were those of pelves with a bony lesion that one would expect might be associated with an ischio-pubic osteochondritis A congenital dislocation of the hip joint throws undue strain upon the ischio-pubic area, and the reduction of the hip adds to the chances of the junction being traumatized Perthes's disease, or osteochondritis of the upper end of the femur—if it is admitted that trauma plays its part in the production of the pathological process—would also be expected to lead to affection of the ischio pubic junction

The pathology of a condition that is 'self-terminated,' and which only leads to a passing slight disability, will probably always be a matter of conjecture I am unable to agree with Mr G Edgar Church's suggestion (July 9, p 94) that it is due to a general condition, such as avitaminosis, general infection, etc Were such the case other areas of growth should be affected In the reported cases the condition is localized, if we except an associated lesion, as in osteochondritis of the upper end of the femur Also, in those general conditions I have seen in which all the growing ends of long bones are affected the ischio-pubic area was not affected

Lesions in the ischio-pubic area cannot be too closely compared with lesions at the upper end of the femur In the former two centres of ossification are approaching along a bar of cartilage and there is a good blood supply at either end In the latter, there is a proximal epiphysis which derives practically all its blood supply from the vessels piercing the epiphyseal plate—that is, from one end—so that, given a similar pathological process, the results will not necessarily be alike The period of pathological change will be shorter and of less intensity in the ischio pubic area with its blood supply from either end, and the clinical signs less marked for the same reasons and because no joint is involved

The name osteochondritis has already been recognized for this condition, and one cannot with any certainty as I have implied above deny that it is correct In attempts to name correctly what I consider to be a similar lesion at the upper end of the femur there have crept into the literature seven different names for the condition This multiplicity of names has not been of any help to the student—I am, etc,

Belfast July 26 GEORGE D F MCFADDEN

Undescended Testicle

SIR—I think the writer of the criticism in the annotation which accompanied my article on undescended testicle (July 23) has attacked a carefully prepared position a trifle over confidently

For instance I wonder how many of your readers noticed that two of the arguments against me very neatly cancel out The first is that a testicle in the inguinal canal can be felt because the tendon of the external oblique is not always tense The second is that it is impossible to tell on examination whether a suprapubic testis is in the canal or in the subcutaneous tissues Now if the first statement were correct the changes in the palpability of the testis with changes in the tension of the abdominal muscles would very clearly show whether it was under the tendon or not In actual fact a testis that can be felt at all in this position can be felt just as plainly whether the child is resisting or is under an anaesthetic Again, anyone who reads the whole of the paper must see that the two categories of "emergent" positions are quite meaningless unless it is possible to distinguish readily and clearly between the testis when it is inside the canal and when it is outside it When the gland pops in it is quite impossible to feel it, when it emerges it is plainly to be felt in the pouch or over the pubis

As to Dr A P Cawadias's letter (July 30, p 209) I feel that we are at cross-purposes rather than in disagreement What I am pleading for is as careful a diagnosis on the material side as he demands on the vital I admit that my statement that pregnyl will never bring down a testis that would not have descended in any case is a sweeping one and in opposition to the findings of other workers on the subject But has he considered that the percentage of cures reported after pregnyl treatment is just about the same as the difference between the incidence of "undescended testis" in childhood and adult life when no treatment is given at all? As to the complete safety of such a substance I propose to wait another sixty years before pronouncing on it—I am, etc,

London, W 1, July 29 DENIS BROWNE

SIR—I have read with interest Mr Denis Browne's article on undescended testis in the *Journal* of July 23 (p 168) He does an important service when he emphasizes the necessity for distinguishing between a superficial inguinal ectopic testis and an undescended testis I am often surprised at the lack of knowledge of postgraduates in a final Fellowship class on this subject and their failure to recognize the superficial inguinal ectopic testis, which is much the commonest type of ectopic testis

I should like to know if Mr Browne really means what he says when he states in more than one place in his article that 'a testis [or testicle, he uses the terms more or less alternately] that is in the inguinal canal cannot be felt through the skin" I would readily agree that some testes which are in the inguinal canal are quite impalpable through the skin, but it has certainly not been my experience that every testis in the inguinal canal is impalpable The proof of their being in the inguinal canal has been the finding of them in that situation at operation—I am, etc,

London, W 1 July 30 JOHN HOSFORD

Irradiation or Surgery for Cancer?

SIR—In the *Journal* of June 4 (p 1231) I made comparison between the results of radium treatment in carcinoma of the mouth, published by the National Radium Commission for 1936–7, and the results obtained by surgery by Mr Norman Patterson

Mr George F Stebbing and Mr Anthony E C Hare from the National Radium Commission saw fit to reply in the *Journal* of June 18 (p 1333) that I had not read the statement made in the seventh annual report (p 44) that The results shown by the survival rates give a picture of the average results of radium treatment in a very widely scattered group of hospitals and must not be compared lightly either with the results of special clinics or *with results based upon a picked series of cases treated by a highly skilled surgeon'* (The italics are mine) They are right There are no figures from scattered groups of surgeons that can be compared with the figures of radiotherapists Therefore it would be futile to compare the work of any one skilled surgeon with that of the Radium Commission Report

Mr George F Stebbing and Mr Anthony E C Hare have however misconstrued my letter I was not condemning radium in a wholesale manner—as they appear to condemn surgery—but mine is a plea that a better balance and sense of proportion should be obtained in the right treatment of these cases The surgeons one might say have only the interests of the patient at heart and are not concerned with the development of an elaborate technique demanding a profound knowledge of the physics of radium and x rays I desire to stimulate inquiry in the minds of persons using methods of irradiation to be sure that the best interests of the patient are being served because my study of the present condition has led me to believe that there exists a most unjust balance I am not at cross purposes but wish to join them in a reasonable inquiry Let us imagine that they or I were suffering from malignant disease Should we not desire whatever advice and treatment were the most efficacious?—and in doing so I feel sure that we would all consult both surgical and radiological colleagues

I still put forward the plea that more cases should be treated by surgery and not by scattered groups of radiotherapists in scattered groups of hospitals all over the country Would it not be better if a form of centralization were adopted whereby all cases might be referred in the first instance to the proper surgeons who have become technically expert in some special branch of surgery? Then when approximately equal numbers (Mr George Stebbing suggests a thousand) were treated by each means a just comparison could be made I am sure with no detriment to surgery

The reason why comparisons are made on such relatively small surgical numbers is that methods of irradiation have been talked about so freely in the popular press that the number of cases referred to surgeons has become less and less Despite this lack of material the surgical mortality rate has decreased materially as the result of improved technique and the introduction of modern anaesthesia (as stated in my letter)

If Mr George Stebbing and Mr Anthony Hare really believe as they state that the technique of radiotherapy has vastly improved and we are not aware that the same can be said of surgery then I feel they must be like Olympus—alone in their thoughts—I am etc

London W 1 July 23 E. R G PASSE

Hormone Therapy in Mastitis and Breast Cancer

SIR—Mr W Sampson Handley described in your issue of July 16 (p 113) a family history of five sisters suffering from chronic mastitis and cancer of the breast We know that a surplus of oestrin acts on the female breast and frequently causes chronic mastitis We can counteract the effect of oestrin by the male hormone testosterone propionate as I described in the *Lancet* of February 12 and May 14 of this year This is the reason why I should recommend using testosterone propionate to influence chronic mastitis In three cases I succeeded in making the lumps in the breast disappear by intramuscular injections of the male hormone Doses between 500 and 1 000 mg must be given These doses inhibit the production of the gonadotropic hormone in the anterior pituitary and prevent the growth and the ripening of the follicles in the ovary which in their turn do not produce the follicular hormone And the surplus of the follicular hormone is the cause of the chronic mastitis I should advise treating cases of chronic mastitis once or twice every year with testosterone propionate even if the chronic mastitis had disappeared

So far as cancer of the breast is concerned it is advisable to treat patients who have already undergone a radical operation prophylactically with high doses of male hormone every year In my opinion this is a better method of avoiding a secondary deposition than irradiation especially in families in whom cancer is hereditary I have done this in two cases of breast cancer—I am etc

London W 1 July 25 ALFRED A LOESER.

Placenta Praevia

SIR—I most heartily agree with Dr H G Oliver (*Journal* May 14 p 1071) in his contention that Caesarean section is not to be lightly undertaken especially after vaginal examination Upon three occasions I successfully conducted confinements employing a technique similar to that described by Dr Oliver In 1929 however it occurred to me that the application of a vulsellum to the foetal scalp would be much freer from trauma to the cervix and freer from the danger of infection Accordingly taking a wide bite (which can be done with only one finger dilatation of the cervix) I employed an ordinary uterine vulsellum forceps with happy results Credit is due to Dr Willett (of whose work at that time I did not know) for designing a special forceps for this particular purpose

If Dr Oliver or any other general practitioner engaged in midwifery should encounter a case of marginal or lateral placenta praevia with only slight dilatation I would urge him to use the Willett forceps not to worry about version and not to dilate manually the cervix which may tear like wet blotting paper and also not to apply forceps until full dilatation has occurred In the absence of full dilatation the use of midwifery forceps in cases of placenta praevia is fraught with the greatest danger—danger of trauma and infection and of death from haemorrhage and sepsis Three further points about the Willett forceps are always carry a pair take a wide bite of the child's scalp and do not apply more than 1 lb weight for traction I slip the forceps through a funnel of one inch rubber so that this rather than the forceps presses against the posterior vaginal wall and perineum—I am etc

Perth Western Australia June 20 H R PEARSON

"Psychosomatic Illness"

SIR—Dr E K Mackenzie (*Journal* July 23, p 197) is evidently in conflict as to whether he approves or disapproves of Dr James L Halliday's articles on psychosomatic illness I am interested to see that among the bouquets that he throws are concealed daggers and even an occasional bomb But what arrested my attention was his statement that within the last few months he had seen a case of carcinoma of the stomach at the age of 19 years two cases at the age of 22 years and one case at the age of 27 years The statement reads somewhat ambiguously and I should like to ask Dr Mackenzie whether he means that he encountered all four cases in general practice within the last few months If so I feel that he has had a most extraordinary experience I was myself in general practice for twelve years seeing an average of over fifty patients a day Throughout this period I neither encountered nor missed one single case of carcinoma of the stomach in a young person But I saw daily many dozens of cases of psychosomatic illness or as I would prefer to call them cases of psychogenic illness—I am, etc.,

London W 1 July 23 CHARLES BERG M.D., D.P.M

Treatment of Carbuncles

SIR,—I read with interest the note on the treatment of carbuncles by Mr A P Bertwistle in the *Journal* of June 11 (p 1284) Packs of saturated sodium sulphate may be left on for three days in cold countries like England as suggested by Mr Bertwistle, but in the humid high temperatures of India it is very uncomfortable for the patient if the dressings are not changed at least every twenty-four hours I have had good results from the four-hourly application of compresses of a hot saturated solution of magnesium sulphate Sometimes, in sensitive patients, the application of magnesium sulphate directly on to the wound is painful and irritating In these cases I cover the actual wound with fine gauze soaked in hexyl-resorcinol and secure this by cross-strips of adhesive plaster This dressing is changed every twenty-four hours, while the four hourly magnesium sulphate compresses are applied over it This softens the necrotic tissue, which can be easily removed by scissors and forceps Along with this local treatment I give collosol manganese either orally or by injection—I am, etc,

Agra, July 19 P K BANERJEE

Thrombocytopenic Purpura from Sedormid

SIR,—I welcome the annotation on thrombocytopenic purpura from sedormid in your issue of July 30 (p 229), but I cannot agree that this at times so serious illness is 'evidently a very uncommon side effect

In November, 1931, when sedormid had hardly been introduced into this country, I was able to prove experimentally that a severe case of purpura had been caused by this drug and in the first paper on sedormid purpura in the *Lancet* of April 21 1934 (Thrombopenic Haemorrhagic Purpura due to Idiosyncrasy towards the Hypnotic Sedormid Allergotoxic Effect), I was already reporting three cases seen by me within little over two years In 1938 so far two new serious cases have been brought to my notice in London

I have reason to believe that frequently the causative connexion between purpura and sedormid has been missed because the makers—a reputable firm—continued to praise the harmlessness of sedormid in their advertisements even after I had brought my experience and publication to their notice Only recently I have at last received the assurance that purpura would be mentioned as a possible side effect but it will naturally take some time before the old packages have been replaced and I should like meanwhile to emphasize the practical importance of the subject—I am etc

London W 1 July 30 F E LOEWY

Effects of Smoking

SIR,—I was much interested in the annotation in the *Journal* of July 23 (p 187) on electrocardiographic changes due to smoking describing the experiments of Graybiel and his co workers In these experiments the smoke from a cigarette was inhaled until toxic symptoms appeared or it was finished and in some cases two or three cigarettes, a pipe or a cigar were smoked In 1929 with the assistance of Mr C A Beck, B Sc I carried out very similar experiments to determine the effect of smoking on the sugar content of the blood It was found that a reduction of the blood sugar was the rule in non smokers and also among smokers although in two cases there was a very slight increase in the blood sugar Maitland (*Journal*, 1933 **1**, 268) states that it is probable that in many adults who suffer from toxic amblyopia—the result of over indulgence in tobacco or alcohol, or both—there is a disturbance of carbohydrate metabolism, and that a systematic estimation of the blood sugar may prove an important factor in both prognosis and treatment A full investigation of this subject offers a promising field for research Graybiel does not think that carbon monoxide is usually absorbed in amounts capable of inducing the changes recorded Armstrong (*Journal* 1922, **1**, 922) stated that quite an appreciable amount of carbon monoxide is present in smoke and is largely determined for example, in cigars, by the closeness of the packing and the rate of smoking He remarked that 1 cubic foot of ordinary coal gas contained an amount of carbon monoxide equal to that in the smoke from four cigars The proportion of carbon monoxide in South Metropolitan gas, it may be added, is about that of average cigar smoke It is evident, therefore, that alterations in the blood pressure and the frequency of the heart beats due to smoking are of a somewhat complex nature—I am, etc

Southampton, July 23 E SAKOSCHANSKY

Bragg-Paul Pulsator

SIR,—With your permission, and with the concurrence of Sir William Bragg I should like to supplement his story of the development of the pulsator, as given in his letter which you print in the *Journal* of July 30 (p 254)

I have received valuable aid and advice, freely given from Dr P M T Kerridge, M R C P of University College, London, and from the Department of Industrial Physiology at the London School of Hygiene and Tropical Medicine To the former I owe suggestions for the form and mode of application of the air bulb which is an essential part of the equipment In the early stages of the work the measurements of ventilation efficiency made at the latter gave me confidence in introducing the Bragg-Paul pulsator to the notice of the medical profession, with the results already reported—I am, etc,

London, W 14 July 30 ROBERT W PAUL

The Services

NAVAL MEDICAL COMPASSIONATE FUND

At the quarterly meeting of the directors of the Naval Medical Compassionate Fund held on July 8 with Surgeon Vice Admiral P T Nicholls Medical Director General of the Navy, in the chair, the sum of £56 10s was distributed among the several applicants

DEATHS IN THE SERVICES

Lieutenant Colonel JAMES CHARLES GORDON CARMICHAEL OBE RAMC (ret) died at Ewell Surrey on July 27 He was born on October 28 1876 the son of the late Colonel J C G Carmichael I M S and was educated at Edinburgh University where he graduated M B Ch B in 1902 He took the Cambridge D P H in 1912 He entered the Royal Army Medical Corps as lieutenant on January 31 1903 became major on October 31 1914 and retired as lieutenant-colonel on August 11 1925 After retirement he went into practice at Ewell where he was honorary physician to the Epsom and Ewell Cottage Hospital He served throughout the war of 1914-18 and was mentioned in dispatches in the *London Gazette* of December 18 1917 He had been a member of the British Medical Association since 1905

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

T D Davies M.A., M.B., B.Chir. has been appointed Assistant in Research in Pathology (Morbid Anatomy and Histology) to the Regius Professor of Physic for three years from October 1, 1938.

The Marmaduke Sheild scholarship has been awarded to G. J. Romanes, B.A. D. J. Bauer, B.A. has been re-elected to the Michael Foster studentship in physiology.

During June titles of the degrees of M.B., B.Chir. were conferred by diploma on Mrs. F. C. Edwards of Girton College.

UNIVERSITY OF LONDON

The following candidates have been approved at the examination indicated:

M.S.—*Brackish (Surgery)*: K. C. Eden, S. H. Wass. *Branch III (Orthopaedics)*: L. J. Somerset.

ACADEMIC POSTGRADUATE DIPLOMA IN MEDICAL RADIOLOGY.—E. P. Allen, J. W. D. Ball, A. G. S. Cooper, N. I. C. Hill, D. J. Hurrell, C. W. S. Jerram, O. Macfeat, B. Y. Mina, J. G. Nel, S. F. Oosthuizen, K. M. Rai, P. N. Vaus, H. H. Winterbottom, Gillespie.

ACADEMIC POSTGRADUATE DIPLOMA IN PSYCHOLOGY.—Eveline M. Begbie, J. D. Copp, Eleano A. Eattell, Phyllis M. Freeston, W. M. Gould, G. H. Kjellberg, Ivy W. Langan, Jeannie McM. McKinlay, H. Sampson, Ralph, Doria M. Wills, Rachel Zabarl. *Part II*: S. C. Amin, Vera D. Deutz, Sylvia C. Harnett. *Part III*: Norah C. Morrison.

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The following candidates have been approved at the examination indicated:

ACADEMIC POSTGRADUATE DIPLOMA IN PUBLIC HEALTH.—S. Amarasinghe, P. H. R. Anderson, Annie R. Chalmers, F. C. L. B. D. Crawford, P. A. Crowley, L. D. P. Dharmaratne, C. W. Dixon, R. Y. Dunlop, A. C. Gee, I. W. Gilbert, M. G. Hyder, O. G. Lloyd, G. A. Macgregor, I. M. Macgregor, M. Markowe, J. S. Minnett, F. Noronha, P. N. O'Dwyer, D. F. Parry, A. I. Ross, A. F. H. Stewart, S. Sivasankara Pillai, J. Taylor, Emils S. O. Thomson, S. C. Thurai Rajah, M. Watkins, Helen E. Wight.

ACADEMIC POSTGRADUATE DIPLOMA IN BACTERIOLOGY.—E. Agius, R. D. Andrews, D. R. Balombe Brown, Dharmendra, Winifred M. Hill, H. D. Holt, W. Lewin, H. H. Stroud, J. M. Vincent.

* Mark of distinction.

UNIVERSITY OF DURHAM

The honorary degree of D.C.L. will be conferred on the Prime Minister, Mr. Neville Chamberlain, on the occasion of the opening of the new buildings of the Medical School at Newcastle upon Tyne on October 8.

The Council of King's College, Newcastle, has appointed J. E. Francis, M.B., B.S., B.Sc., assistant demonstrator in the Department of Physiology.

UNIVERSITY OF EDINBURGH

A graduation ceremony was held in M'Ewan Hall on July 20 when the following degrees and diplomas were conferred:

HON. LL.D.—The Right Hon. Walter Elliot, Elliot, D.Sc., M.B., F.R.S., Minister of Health.

M.D.—D. Bell, *D. S. Cownie, G. Fraser, K. Girgis, J. W. D. Goodall, J. L. Henderson, R. Lees, A. D. Macdonald, A. M. Mackenzie, N. Macmichael, G. R. M'Nab, C. de C. Martin, *R. Scott, E. Townsend, *H. L. Wallace, * D. Wyllie.

M.B., CH.B.—A. Y. Adam, J. A. W. Adams, T. M. Adnams, A. S. Affara, B. H. M. Aldridge, J. H. Annan, S. V. Appavoo, R. S. G. Arnott, R. B. Baird, †J. M. Barkla, F. C. Barlow, Olive B. Bernetson, J. B.Sc. PATHOLOGY. *First Class*.—†R. M. M. Hunter.

DIPLOMA IN PUBLIC HEALTH.—J. Cooper, Winifred M. Dempster, J. M. Irvine Young, S. B. Lal, D. C. Logan, A. M. Diarmid, J. S. Oliphant, Isabella A. Purdie, F. Townsend.

DIPLOMA IN TROPICAL MEDICINE AND HYGIENE.—H. Hastings, E. Maung.

DIPLOMA IN PSYCHIATRY.—J. K. Grant, J. S. Johnstone, A. Paterson, G. R. Pile, F. M. G. Prendergast, H. Stalker.

DIPLOMA IN MEDICAL RADIOLOGY.—R. J. C. Campbell, D. B. Faulds, M. Y. Khan.

* Commended for thesis. Highly commended for thesis.
† Passed with honours.

The following prizes were presented:

Cameron Prize in Practical Therapeutics: Karl Landsteiner, M.D. (Vienna), member of the Rockefeller Institute for Medical Research, New York. In recognition of his researches on isohaemagglutinins and blood groups and the influence of his discoveries on the practice of therapeutic blood transfusion. *Ettles Scholarship and Leslie Gold Medal*: Beanes. *Prize in Anatomy and Surgery*: Anwar Dale. *Gold Medal in Clinical Surgery and Murdoch Brown Silver Medal in Clinical Medicine*: J. M. Barkla. *Scottish Association for Medical Education of Women Prize*: Marion B. Bethune and Jessie R. M'C. Fulton (equal). *Mouat Scholarship in the Practice of Physic*: Marion B. Bethune. *Buchanan Scholarship in Midwifery and Gynaecology*: G. W. A. Dick. *James Scott Scholarship in Midwifery and Gynaecology and Dorothy Gilfillan Memorial Prize*: Jessie R. M'C. Fulton. *Conan Doyle Prize*: A. C. Watt. *Royal Victoria Hospital Tuberculosis Trust Gold Medal*: G. R. Hales. *Bartleman Prize in Clinical Medicine*: J. Cohen. *Syme Surgical Fellowship*: D. L. C. Bingham. *Stark Scholarship in Clinical Medicine*: H. Milne Redhead. *Vans Dunlop Scholarship in Materia Medica and Medicine*: J. Innes. *Ellis Prize in Physiology*: Barbara Petrovskaia. *Gunning Victoria Jubilee Prize in Chemistry*: J. L. Bolland. *Gunning Victoria Jubilee Prize in Materia Medica*: J. C. Lees. *Gunning Victoria Jubilee Prize in Therapeutics*: H. W. Devere and D. Wallie (equal). *Gunning Victoria Jubilee Prize in the Practice of Physic*: J. W. D. Goodall. *Gunning Victoria Jubilee Prize in Psychiatry*: W. M. Millar. *Lewis Cameron Postgraduate Prize*: R. Scott. *Thomson Memorial Medal in Child Life and Health*: J. L. Henderson. *Lewis Cameron Undergraduate Prize in Bacteriology*: G. R. Millar. *Maclagan Prize in Forensic Medicine*: L. S. Cooke. *Wellcome Gold Medal and Prize in the History of Medicine*: H. W. Smith. *Wellcome Silver Medal and Prize in the History of Medicine*: H. L. de Waal. *Cunningham Memorial Medal and Prize in Anatomy*: J. R. Lauckner. *Proxime Accessit*: Elizabeth G. Harris. *Whiteside Bruce Bursary*: R. T. S. Louttit. *Vans Dunlop Prize in Botany and Zoology*: M. S. Fraser.

An address was delivered to the new graduates by the Chancellor, Lord Tweedsmuir.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

At a meeting of the Royal College of Surgeons of Edinburgh held on July 23 with Mr. W. J. Stuart, President, in the chair, the following, having passed the requisite examinations, were admitted Fellows:

H. Aitken, M. M. Ali, N. F. Babbage, G. K. Bhide, Ida L. Birchall, R. B. Eaton, J. A. Elliot, C. A. Haysmer, R. G. Henderson, S. Henderson, G. W. A. Keddy, J. S. Kinnear, S. Klemot, P. Kohnstamm, L. R. Levy, J. Ll. Lewis, R. A. Lucas, N. M. L. Lund, J. S. Mackay, D. E. Mackenzie, I. Mackenzie, J. A. Magnus, D. V. Marshall, D. A. O'Reilly, J. F. Philip, D. F. Price, D. K. Rao, J. B. Shield, D. F. Smith, Anna Vareed, P. M. Williams, W. W. Wilson, J. Wolfowitz, W. A. Wright.

Medical Notes in Parliament

On July 28 Mr Hore-Belisha announced conditions of service, pay, and retirement for combatant officers of the Regular Army Sir FRANCIS FREMANTLE asked whether any corresponding advances would be given to the Royal Army Medical Corps or other technical corps Mr HORE-BELISHA replied that each technical corps had its own manner of enlistment and recruitment which differed in each case but each one was being looked into

Quack Medicine Trade

[In these columns last week we gave a brief account of the debate on the quack medicine trade, which was opened by Lord Horder in the House of Lords on July 26 The following is a fuller report of this important discussion]

Lord HORDER said it might be thought that his topic was rather a hardy annual but he assured them that the question of quack medicines in relation to the health of the public was not really so much a hardy annual as a pernicious growth When he suggested dealing with this subject the first objection raised by his friends was that he would have vested interests heavily against him—the vested interests, that was of newspapers and their proprietors the large Press agencies and those who owned hoardings and posters It was becoming more and more obvious that the head and fount of the offence in the matter of quack medicines was the advertisements, so often grossly misleading if not actually fraudulent

Far from any signs of opposition he had received both help and encouragement from the reputable members of the groups to which he had referred For very decency's sake and a sense of duty these people were themselves taking steps to exercise a degree of control and censorship which in other countries responsible authorities imposed He had received assurances on this matter from the Proprietary Association of Great Britain the Newspaper Society the Advertising Association, the Periodical Proprietors Association and the Institute of Incorporated Practitioners in Advertising Seeking again for advice from all authorities in any way connected with this subject of course he was warned that 'they will say that if you as a doctor raise this subject, you will be charged with trying to create a monopoly for your colleagues, you will be charged with depriving the poorer classes of cheap cures to the efficacy of which they constantly testify On this question of monopoly he believed it to be true that if there was a monopoly it lay with the trade which, at a cost of nearly as much as the total money spent on the whole of our hospital services bled the public to the tune of between £25 000 000 and £30 000 000 a year He was seeking to break this unscrupulous monopoly a monopoly which successive Governments seemed almost to have gone out of their way jealously to guard witness the exclusion of patent and proprietary medicines and food from the otherwise excellent Food and Drugs Bill which was about to become law

DOCTORS BENEFIT FROM QUACK MEDICINES

Referring to the position of the doctor Lord Horder said he felt sure that Lord Dawson would agree with him that if the doctor thought only in terms of hard cash in this matter he would actually benefit from this unprincipled trade The doctor had eventually more patients because of this, and not fewer Especially would the surgeon benefit for cases became serious in proportion as diagnosis and treatment were delayed Ultimately even the undertaker benefited sooner and oftener than he might In striving to cleanse this Augean stable he (Lord Horder) was not acting in the interests of doctors He was acting in the interests of the public which was least able to stand up against exploitation—poorer people who could less afford to lose money on health than any other section of the nation and the straitened middle classes People who were better off but perhaps not less foolish could afford to pay for any damage which their adventures into quack medicines might incur

The third objection with which he would deal was expressed by those who said, 'It is all very well to be destructive but if the citizen does not send his coupon for his lung cure and if he does not get his diagnosis by post for his kidney trouble and if he does not get his gastric ulcer healed with a patent powder what is there for the poor citizen to do' Now and perhaps only now we had something infinitely better to put in the place of these extremely dubious specifics We had now available to the poorest everywhere one of the finest health services in the world, and the slogan "Use your health services" was one of the most intelligent slogans he had ever heard Health services, constantly expanding health insurance services were what the Government could and must now encourage the people to put in the place of this medieval witch-doctoring

There were clear and abundant reasons why the present chaotic state of the law in relation to quack medicines should come to an end His main reason for pressing the motion for papers at this time was his deep concern for the success of the concerted move we were making towards national fitness By fitness he did not mean muscular supremacy but meant health as a basis for good citizenship and happiness Men and women of all parties were converging on this objective They were all genuinely moved with the desire to help Anything directly bearing on the basic health and happiness of the people was outside party politics He knew from the support he had received during the past few days when it was known that he was going to put this subject before the House of Lords that it was commonly felt that in the realm of party politics there was no room for the question as to how we should keep the nation fit

INCONGRUOUS SITUATION

The incongruity to which he referred in his notice was apparent to everyone On the one hand the Government had launched a campaign to improve the national physique had recruited all of them whose business it was to know something about health had set aside subsidies for the purpose of education and demonstration in regard to fitness and had spent quite a lot of money in health propaganda On the other hand they had this campaign of quack medicines and food totally uncombated so far by the Government but by very subtle and skilled generals bent on maintaining national ill health moral and physical in order to have a ready market for their goods For every £100 that the Government spent on making people health conscious quack medicine mongers spent £1 000 in making them disease conscious While were trying to teach people the meaning of nutrition and the money they might spend on food they were spending on quack medicines or on very poor substitutes for good food Those were the considerations which led him to bring the subject before the House We had recently witnessed what financial friends assured him was a most necessary and thought creditably expeditious effort to limit the evil called share-pushing It seemed to him that if the State so readily protected the property of its less wary citizens against financial sharks it should not regard it as less important to take some steps to protect their health from wanton damage

A famous group of patent and proprietary medicine vendors catering chiefly for nervous and digestive disorders had just budgeted for nearly £1 000 000 for Press advertisements alone during the current year This particular group covered some sixteen preparations if one excluded shampoos and dog and cat medicines He saw that it was about to buy the control of six to ten more preparations The profits on the deferred shares had risen from £40 000 to £280 000 in the past five years In 1931 the price of the 5s shares stood at 5s and in each of the past three years these shares had risen above £3 These figures gave some indication of the lucrative nature of the concern and of the great expansion of the quack medicine trade No wonder that the board of this concern thought it a wise thing to make a large donation to one of the London hospitals He was unable to inform their lordships if the donation was earmarked for the treatment of patients who had doctored themselves with the company's medicines

THE PUBLIC AS A CONSERVATIVE

A few patented and proprietary things were good things and the claims made for them as claims went were not unreasonable A good many things that did little or no good and little or no harm were sold at fantastic prices But now and again something was sold that did infinite harm—not often because an inquest was a thing that put some of these people out of business more quickly than anything else and for that reason dangerous drugs were as a rule avoided All the same there was nothing in law to prevent a vendor in this country from trading in some new drug not as yet on the Poisons Schedule and concerning which experience of its action was required to discover the danger In other words the public was made the guinea pig as it were of the unscrupulous vendor

But there were an enormous number of preparations which were fraudulent in the degree of the advertisement—fraudulent in the claims they made and very fraudulent in the way in which those claims changed without any change in the nature of the specific The public was slowly becoming aware that certain diseases like cancer and hernia were not cured by drugs and the advertiser was quick to realize that So disease conditions which were for any reason in the public mind were made the means of selling the same old goods For example the subject of malnutrition was topical now and a number of preparations formerly advertised to cure quite different conditions were now advertised as a cure for malnutrition A set of new preparations arose which claimed to do the same thing The subject of vitamins having become somewhat popular it would be found that quite a large proportion of the quack medicine advertisements to-day claimed that they contained "all the vitamins necessary for health

Some people had recently become rather anxious about the prevalence of rheumatic disease in this country and straight away the quack medicine vendors orientated their advertisements in that direction Advertising had become a specialized profession The maker of quack medicine need no longer rack his own brains as to how best to overcome any reluctance the public might have in spending He handed the matter over to the advertising specialist together with a large sum which had been appropriated for this purpose and the thing was put across the public as they said There was a rake off for the manufacturer the advertising agent and the newspaper When they remembered the enormous increase in the media through which advertisement operated—newspapers omnibuses hoardings wireless and aeroplanes—they began to realize the appalling results which this mass suggestion must eventually have upon the country's health and morale These advertisements had become a much graver danger than the medicines they sold Fear was the chief emotion they relied upon so that much of this trade was in effect a huge form of blackmail

It was all very well to vet the medicine and reject its advertisement if harmful which was claimed by some responsible newspaper proprietors but there was poison in the advertisement Nobody seemed to vet the advertisements except a few papers and he paid them all credit for that A picture that he had was of an operating theatre with the surgeon and nurses in their masks and it said Buy our invaluable ointment and you will escape operation and the result is guaranteed There was another a picture of a strong acid burning a hole in the carpet which said This is what is happening inside your stomach when it pains you Take our tablets and you can eat anything Then there was a diagram of a circle a very considerable part of which was coloured on the poster to represent the proportion of nourishment in a certain meat juice The representation was a lie because the stuff was mainly extractives which were not nourishing salts and colouring matter and the actual food value was almost negligible Of course everyone takes a laxative said one advertisement so why not ours? And the wretched man who did not take a laxative began to wonder if he could possibly be well without it Four out of five have pyorrhoea —which was not true—said another advertisement But the chances were so heavily loaded against the reader that the goods sold

A MENACE TO HEALTH

So he might go on almost endlessly It was perhaps because some of our Continental friends had been reading our advertisement pages that they thought that Britain had become decadent This of course was in the language of the street a ramp It was not only demanding money with menaces it was coining money out of the fears of the people Not only the sick but the well were swindled for by what other word could they rightly stigmatize the deliberate promotion of credulity for the purpose of gain? In Continental countries exploitation was forbidden It was forbidden in the United States in Australia and Canada there were heavy penalties for making false and fraudulent claims and even in South Africa last year a Bill was introduced based on the recommendations of the Select Committee of this country of 1914 It was humiliating to think that Great Britain remained complacent in face of this menace to the health of her citizens

The Government as well as the others got a rake off and it was sometimes thought that this fact prevented legislation He could not think that that was a very powerful preventive of legislation in this country because the Chancellor of the Exchequer only netted £1 000 000 a year out of this sordid business Of course he could make much more the Medicine Tax Act of 1812 was being evaded in the grossest manner To quote only one anomaly taxes were levied only *on drugs advertised as a cure for ailments* and so cough medicines and pills for backache were taxed but chest mixtures and kidney pills were exempt

It was nearly fifty years since a Royal Commission stated that the India opium revenue was morally indefensible and within a month of the presentation of its report Parliament approved it Yet there was the report of the Select Committee on Patent Medicines a compendious document which was so ill fated as to be printed on that tragic day August 4 1914 That was twenty four years ago and the committee's recommendations simple though they were—registration disclosure and censorship of advertisements—had never been implemented Why were we so prompt to protect the Chinaman and so dilatory in protecting our own citizens? Yet his analogy was fairly close because to paraphrase a famous saying Quack medicines are the opium of our people

What was the remedy? With the best intentions for which he gave the reputable newspapers every credit no censor nor hip of their own would ever effectually deal with this nuisance This voluntary effort had been on trial for more than twenty years and things were now much worse than before Central or Government control would tighten up the situation at once The people who might be expected to know—that was the owners of large newspaper combines—supported him in this contention He had letters quite a number from noble Lords to this effect and they agreed with him that the evil must be attacked at its source These papers which were trying to-day but unsuccessfully to control the grosser forms of exploitation of their readers would by some central control be protected and not penalized as at present they were

GOVERNMENT ACTION REQUIRED

Lord Southwood who was president of the British Advertising Association had told him that an important department of that association devoted its efforts to the elimination of advertisements of undesirable products Yet as an example of how impossible it was to carry out this good intention in practice he had there that afternoon an advertisement of Yadil in that week's *John Bull* and it was fourteen years ago that Yadil was so thoroughly exposed in three successive issues of the *Daily Mail* that its sale was entirely stopped This was the stuff that did not contain the harmless ingredient which it was alleged to contain but 1 per cent of formalin an intense irritant of which it made no mention True the figure 1935 appeared now in brackets after the name Yadil That might mean something or nothing The point was that this monster was hydra headed and it could only be destroyed by being strangled at its birth

It was only fair to admit that a few things had been done since 1914 and they were to the good The Venereal Diseases Act made it an offence to advertise medicines for venereal

disease, and the very success of this veto showed that measures of this kind were both practicable and effective Then there were the Pharmacy and Poisons Act, the Dangerous Drugs Act and the Therapeutic Substances Act, but good though all these laws were taken together, they did not touch the real problem he was presenting to the House In the Food and Drugs Bill there was a great opportunity of dealing with this pest Instead of that quack medicines were specifically exempted from any penalties under that measure—an exemption which renewed automatically the exemption made in the previous Food and Drugs Act of 1928 In Part I of the new Bill, Clause 4 dealt with defences available in proceedings taken under the Bill Subsection (3) contained the words where the food or drug in question is the subject of a patent in force and Subsection (5) read that the article supplied was a proprietary medicine and was supplied in response to a demand for that medicine In short, no action could succeed under that measure if it were attempted

A record of the Bills that had been introduced into the House of Lords and the House of Commons since 1920 made very gloomy reading They had generally died of that common disease lack of Parliamentary facilities, though in one or two cases a more accurate explanation of death would be *felo de se* On the last occasion the failure of the Bill in the House of Commons was attributed to its having had the bad luck to be introduced on the day of the Grand National There appeared to be a 'hoodoo' resting upon private Bills dealing with this matter He earnestly trusted that the House would support him in his efforts to persuade the Government to tackle it by a Government measure The machinery would be easily forthcoming His friend and colleague who now had charge of the Ministry of Health must by virtue of his training and experience, have exceptional knowledge of the whole of this subject, and must be more fully alive perhaps than some of his predecessors in that responsible office to the importance of the matter He (Lord Horder) believed that the Minister would have the opinion of the country behind him and he had good reasons for believing that the Press as a whole would support him A Bill dealing with this would be a most fitting corollary to the efforts we were all making for national fitness It would demonstrate clearly to the world that the Government was really serious in regard to their health campaign It would close a wide gap in our defences a gap which was increasing month by month and through which at the moment the enemy was pouring and spreading havoc among our people Once behind the lines there was no limit to the damage which this particular enemy could do

PUBLIC EDUCATION IN USE OF COMMON DRUGS

Lord FARINGDON in supporting the motion suggested that the recommendations of the 1914 Committee in one respect at any rate did not go far enough They suggested the registration of preparations and disclosure to a Government Department of their contents There was no reason why this disclosure should not be absolutely public, he suggested, in view of the experience we had now of the extraordinarily abstruse and incomprehensible nature of disclosure of contents of secret remedies which was made in many cases incidentally to avoid the Government tax that there should be a legal obligation to make them in a form generally accepted by the medical profession so that there should not be any misunderstanding as to what was contained in any preparation that was sold It would of course be said that that would not affect a great many of the public who would be unable even if they knew the nature of the actual drugs in a preparation to judge for themselves of their efficacy That was true but a purchaser would always be able to consult his medical practitioner or the chemist from whom he bought as to the value of a particular drug Lord Horder had fully repelled the suggestion that members of the medical profession had any personal or financial interest in the perpetuation of this trade The medical profession had, he thought, shown a really admirable attitude since the eighteenth century in forbidding to members of the profession the use of secret remedies and insisting on publication Nevertheless something might be done by the medical profession itself in co-operation with education authorities He suggested to Lord Horder that perhaps it would be possible to give more public instruction in the use of household remedies In that way people who had headaches would not buy some kind of headache powder, they would know for example, that an ordinary aspirin was in any case the active drug in any preparation which they were likely to buy, and that it could be obtained in a purer form at a very much cheaper price direct from the chemist That was naturally only one of many possible examples The general public in the interests of its health, should be educated to appreciate the use of common drugs

Lord ADDISON said that Lord Horder had studiously understated his case and had done it deliberately In 1920 or 1921 he (Lord Addison) remembered as Minister of Health being a party to the initiation of proceedings that led to a joint conference representative of all the various interests concerned including medical men and newspaper proprietors, which made recommendations This step did not go very far it was a very tentative and moderate approach to the matter He only mentioned it to emphasize the certainty that if the Government would remove what Lord Horder had described as *the fear which beset private Bills* and take on themselves the responsibility in this matter they would be supported much more vigorously and widely than they suspected The general public would be glad to be protected against this exploitation, which had been enormously increased during the last few years The modern advertiser had a technique in which he promoted what he called a suitable atmosphere and this technique during late years had been imported into the advertisement of these various nostrums The technique played particularly upon the fear of people and drove them into that state of apprehension which Lord Horder had described as being so exceedingly dangerous to a vast multitude of sensitive and nervous people

GOVERNMENT REPLY

Viscount GAGE said that he was sure the Minister would wish that the speeches of Lord Horder and the other noble Lords should command a wide attention It was perfectly true that every investigation that had been made had borne out that the improper use of drugs and of substances in themselves harmless was a distinct danger to health in this country that it had handicapped the work of the medical profession and that they were behind other countries He would be quite ready to agree with Lord Horder that it might constitute an obstacle to the national fitness which they all wished to obtain The problem of the dangerous drug had largely been solved, except possibly for the case mentioned by Lord Horder—namely that of the new drugs that were continually being put on the market by the enterprise of manufacturing chemists He thought that Lord Horder had some criticism to make on these new medicines He had said that the public had been used as a guinea pig by the unscrupulous manufacturers He (Lord Gage) was informed that there was no real method of foretelling what the effect of some of the new compounds was going to be It was true that their effect on the human body could only be ascertained by experiment and he believed there had been fatal cases abroad where these experiments had been incomplete This constituted a possible danger but it was one which was very difficult to guard against without putting an absolutely undue restriction on these very valuable new inventions He understood that the majority of these substances were made by firms of the highest possible repute, which in their own interests saw that the precautions which were taken were very complete He believed that the dangers arising from that possible source were really remote

The real difficulty as Lord Horder had pointed out arose from drugs and substances which were not in themselves harmful and which could not be scheduled as dangerous or poisonous The improper use of these did constitute a danger and that danger arose in two ways Aspirin if used properly did provide a remedy or relief anyhow for a number of illnesses, if used to excess it was not beneficial If aspirin

was not used to excess but was used to cure some dangerous fever then it did harm because it might prevent proper treatment being applied It was true that if these unfortunate results could arise from the improper use of these reputable products advertised in a respectable way far worse results could obviously ensue from the improper use of other drugs presented to the public with far less regard to truth and with far less security of quality

The inherent difficulty in dealing with these substances was that the real fault lay with the individual who took them It was surely just as difficult to stop people indulging in the excessive use of drugs and medicines as it was to stop people from excessive indulgence in drink If people did not use the immense State assisted medical schemes which had been provided for at least 18 000 000 of the inhabitants and if people preferred to diagnose and treat their own complaints it was surely largely their own responsibility if they suffered in consequence It was true that they might be encouraged to do so by carefully worded advertisements and he agreed in theory that there was a case for controlling these advertisements but here again he thought the resources of the legal profession could easily be turned to bad account and it was very easy to find forms of words which evaded the penalties that might be devised in Acts of Parliament unless these Acts were so strict as to bring within the meshes of their nets a number of perfectly harmless and well-established compounds that could at present be cheaply and easily procured It was not always easy to devise forms of words which could not be evaded He was surprised to hear Lord Horder and Lord Farnedon say how easily they thought this control of advertisements could be effected He was not attempting to exclude the possibility of some legislation on the lines suggested but it would be very difficult to guarantee that such legislation would be effective It had been suggested that certain advertisements relating to certain specified diseases should be prohibited altogether, this had been done so far as venereal disease was concerned A Private Member's Bill was recently introduced in the House of Commons to extend this prohibition to other diseases and if that Bill had gone any way it would have received the sympathetic consideration of the Government. What happened was that during the second reading the House was counted out and the Government were unable to take any action sympathetic or otherwise because the Bill was automatically dropped

Parliamentary apathy in these matters was frequently explained by the phrase "vested interests" to which Lord Horder had referred He appreciated the tone in which Lord Horder referred to that pressure but others of his colleagues had gone a long way further than he had gone He noticed that in an article Professor Clark had said that the obvious reason why Parliament has refused for a quarter of a century to attempt to remedy any of the disgraceful abuses revealed by the report of the Committee is that the Press controls the politicians and the secret remedies trade associations control the Press"—the argument being of course that vested interests represented by advertisers in the Press were so strong that the Government were powerless against them They might be perfectly certain that no major reform had ever been or was ever likely to be effected in this country except in the face of vested interest of some sort He thought that Professor Clark was rather severe on the Press and he was glad that Lord Horder treated the matter in a different way

If he was asked to say why successive Governments had done so little in this matter he should first explain it by the popular theory that people had the right to make fools of themselves in their own way provided they did not do harm to other people That might perhaps sound a rather crude argument but he put it to Lord Horder that surely the point was to be considered whether there was no danger in weakening the individual sense of responsibility in these matters Secondly they could not legislate effectively without at least risking adding to the difficulty and expense of obtaining remedies which were in many cases harmless and beneficial In saying that he was not trying to exclude the possibility of further repressive and restrictive legislation he said most emphatically that repression alone was one of the most dubious of all lines of progress Lord Horder would agree that it was only education as to what health and fitness meant that would really induce people to refrain as the well known phrase went from pouring drugs of which they know little into bodies of which they know nothing The Minister of Health would carefully examine what Lord Horder had said and would see whether anything could be done to incorporate in the educational side of the national fitness movement something of a warning nature against the misuse of drugs generally

He had tried to be frank in answering Lord Horder Lord Horder might not be convinced and if that were so perhaps he would like to have a try at legislation himself In spite of the fact that there was a great mass of public opinion behind him in this matter the only explanation Lord Horder gave why private legislation had failed was in the perhaps somewhat unscientific phrase that there was a hoodoo on private Bills He assured Lord Horder that on legal matters the Government would be very pleased to place all their resources at his disposal and on medical matters they had no higher sources of information than those which he himself could command The Government's own attitude must be to some extent at any rate dictated by public opinion because in these matters the public must have the last word He was prepared to lay any papers that Lord Horder liked but he hoped he had met the main arguments to his satisfaction

Lord HORDER said he understood that he had free access in a private capacity and he would like to avail himself of that He asked leave to withdraw the motion

The motion for papers was withdrawn accordingly

Work of the Ministry of Health

When the House on July 28 went into Committee on the Appropriation Bill D ELLIOT made a statement on the Ministry of Health Estimate for 1938 He said the net total of £22 752 572 was an increase of £ 2 206 over the figure for the preceding year This increase was mainly due to progress in respect of housing and under the Midwives Act of 1936 For the latter it was £250 000 After dealing with housing slum clearance planning atmospheric pollution sewerage and water supplies Dr Elliot turned to air raid casualties In air warfare it was impossible to forecast with certainty where casualties would occur What was intended as a base hospital might be required to function as a casualty clearing hospital The casualties occurring in a particular locality might prove to be beyond its hospital resources even if its peace time accommodation had been considerably augmented They must aim at pooling hospital resources over a wide area and making provision for additional beds and equipment where this seemed to be necessary Plans had to be worked out for moving as many as possible of the peace-time sick from the hospitals best suited to deal with casualties and for transporting the casualties themselves from raided areas to hospitals in less vulnerable positions His Department was at work on these lines and would submit them as soon as possible to the local authorities and others concerned A survey of hospital accommodation throughout the country had been in progress since early this year Medical and other officers of the Department had been assigned to various districts in the country to maintain close contact with the local authorities and managers of voluntary hospitals in working out schemes which could be put into operation immediately if required Co operation between the municipal and voluntary hospitals was essential for the proper planning of this work In the London area a number of hospital experts presided over by Sir Charles Wilson dean of St Mary's Hospital had submitted provisional conclusions and he had conveyed them to the Voluntary Hospitals Committee for London as well as to the local authorities in the area The next step was for officers of the Department to work out the plan in greater detail for individual hospitals This was being done

FALL IN INFANT AND MATERNAL MORTALITY RATES

The vital statistics for the year 1937 bore witness to the improvement in the public health which had been continuous

in recent years The number of live births registered during the year was 610 557 corresponding to a rate of 14 9 per 1 000 population The provisional figures available for 1938 suggested that the rise was still continuing The increase in the birth rate since 1933 had been accompanied by a fall in the infant mortality rate, which stood at 58 per 1,000 live births in 1937, the second lowest rate ever recorded compared with 64 in 1933 The crude death rate per 1 000 population last year was 12 4 This showed a rise of 0 3 per 1 000 over 1936 Many deaths were due to the prevalence of influenza and influenzal conditions during the earlier part of the year The crude death rate from all forms of tuberculosis was 692 per million population in 1936 the lowest yet recorded a rate which was practically maintained in 1937 The exact figure was 695 per million

The maternal mortality rate in 1937 fell to 3 13 per 1 000 total births the lowest rate recorded There was room for renewed efforts to secure a greater reduction, and measures already taken appeared to be showing results

The number of attendances of children at infant welfare centres expressed as a percentage of live births was 63 and the number of attendances of expectant mothers at ante-natal clinics similarly expressed was 54 Both these figures were records During 1937 local authorities improved their maternity services on the lines recommended in recent reports on maternal mortality in England and Wales above all by promoting co operation between doctors health visitors and midwives which was essential Mr Norman Birkett's committee had investigated the question of abortion, and the report might be available before the end of the year Throughout England and Wales local authorities now ensured the employment of nearly 7 500 midwives on an improved and permanent basis by engaging midwives as their own servants and by making extensive use of those voluntary associations which had done such excellent service in the past and still continued to do so The establishment of the service had now been substantially achieved The Central Midwives Board had made rules embodying important alterations in training which would come into force by stages beginning in the autumn In the future trained nurses would undergo 4 years training instead of six months and other potential midwives two years instead of one year Practising midwives would be required to take post certificate courses at least once every seven years By the payment of increased grants in aid of training the supply of fully qualified practising midwives would be stimulated

The scheme for the provision of certain additional items of diet to expectant mothers which with the aid of grants from the Commissioner for the Special Areas was begun by the National Birthday Trust Fund, was now being carried out by the Joint Midwifery Council It must be regarded as still in the experimental stage Local authorities made increasing use of their powers to supply milk free or cheap to expectant and nursing mothers and children under the age of 5 A Bill had passed both Houses which would enable a scheme to be brought into operation for securing a reduction in the price of liquid milk to local authorities for maternity and child welfare purposes Arrangements were under active consideration

HOSPITAL SERVICES OF THE COUNTRY

In addition to specific services such as those for tuberculosis and venereal disease the years since 1929 had seen remarkable developments in the general hospital services The increase in the number of beds had not been strikingly great but there had been a continuous improvement in the standard of treatment equipment and accommodation Whereas in 1932 88 000 beds in local authority hospitals were in Poor Law institutions and 38 000 in public health hospitals the corresponding figures for 1937 were 69 000 in public assistance institutions and 60 000 in public health hospitals Transfer from Poor Law to public health had not only given an opportunity for an improved service but made possible and indeed essential close co operation between local authority hospitals and voluntary hospitals In many areas co operation had been developed and there were signs of a growing recognition by those responsible that general hospital accommodation, however provided should form a pool for use to the maximum advantage of the whole population It might be that they were on the eve of expansion and reform in the hospital world

Last autumn a campaign with the slogan 'Use your Health Services' was inaugurated by the Prime Minister with the support of Lord Addison and others To draw attention to the health services was only a small part of health education Much could be done to inculcate positive rules of hygiene and the healthy way of life especially by means of the film Good work was already done in this field, but there was room for more He hoped local authorities would support the work of the Central Council for Health Education a co-ordinating and executive body on which the medical profession was represented

MEDICAL RESEARCH

Further progress had also been made in research on influenza The first widespread epidemic of influenza since the recent work on the transmission of the virus began in December 1936 The results obtained confirmed experimental identification of the virus as the primary cause of the infection In remedial work the group of drugs of which prontosil and sulphanilamide were members had been the subject of much further study and application The result of the use of these agents were as good as anything that had ever been shown in the early history of remedies—so good that they must be treated with caution and checked in the true scientific spirit

In conclusion Dr Elliot said the nation could not afford to lose every year nearly 2 000 mothers and more than 35 000 children under the age of 1 year They could not view with complacency an annual death roll of nearly 30 000 persons from tuberculosis and nearly 70 000 from cancer, or the estimated loss of 5½ million weeks every year owing to rheumatism a disease to which one sixth of industrial invalidism was due They were beginning to realize how much could be done even in the case of those at present considered normal and fit

MEDICAL CRITICISM

Dr HADEN GUEST asked Dr Elliot why, in the appointment of a committee which had been asked to advise on the organization of hospitals in the London area under the air raid precautions arrangement, the British Medical Association was not consulted Dr ELLIOT said this was a matter of material The British Medical Association had undertaken a review of the personnel available and when these two inquiries were completed the Ministry would be able to bring the two halves of the plan together

Captain ELLISTON said that the Health Department of the Borough of Kensington reported that of the 500 women attending an ante-natal clinic 100 admitted that at some time they had tried to procure abortion In nineteen cases they had been successful and in ten admitted that they used the female pills advertised in the less reputable newspapers The medical officer of health for Kensington recommended that mothers attending clinics should be educated in the dangers of abortifacients that the sale of these should be prohibited and that there should be an extension of notification to include termination of pregnancy Of these 100 women fifty three had used proprietary pills

Mrs TATE said the report of the Board of Control for 1936 showed the number of persons in institutions for mental disorder was about 155 000 and that the mentally defective people under control were between 80,000 and 90,000 Mental ill-health nearly approximated to the whole physical ill of the nation because in ordinary hospitals there were about 198 000 beds Some mental hospitals really gave curative treatment but in a large number of hospitals all that could be said was that the sufferers were kept out of harm's way She urged that the old turbulent lunatics should be segregated in the more old fashioned mental hospitals and that more up to date hospitals should be kept for cases in which there was a chance of cure In regard to the recent case of Dr Bour

it was time Parliament considered whether the action taken by Dr Bourne should not be permitted in cases of girls only about 14 years whether the girl's health was in danger or not More inspection should be made of conditions of hygiene in nursing homes

Dr EDITH SUMMERSKILL speaking on maternal mortality said the final report of the Departmental Committee showed that of mothers who died and should be saved 7 per cent died from lack of facilities and 7 per cent through negligence on the part of the patients that 5 per cent of the deaths were due to lack or failure of ante natal care or error of judgment Expert midwifery was a factor of major importance and she regretted that her profession did not face up to it Six years ago it was recommended that education in obstetrics for medical students should be improved She qualified in 1924 and was qualified in midwifery simply by being in a room where twenty confinements were conducted though she never went near a bed or touched a patient She was lucky because her father was a general practitioner and so she had been able to get expert tuition at home Nevertheless she was signed up and certified as being qualified to conduct a confinement without having conducted one in a hospital In reply to Sir Henry Morris Jones she said she did not attend one case outside hospital On November 1 1938 the licensing authorities were going to be told that the education of students in obstetrics must be improved She had a copy of the recommendations and found to her horror that a student was still to be signed up after twenty cases which need not present any abnormality That was a kind of confidence trick played on the mothers who believed that every doctor was fully qualified

She was glad to hear from the Minister that films and lectures were used to make people health minded but she referred him to the speech made by the President of the British Medical Association in the previous week when he said every child in elementary schools should be instructed in anatomy and physiology The ignorance of the average patient on the location of his organs when he went to see the doctor was equal to that of a native in darkest Africa Education was particularly necessary in the case of potential mothers. She pressed upon the Ministry the need to attend to the final recommendations of the Departmental Committee on the Medical Staffing of Maternity Hospitals To-day many patients sent into maternity hospitals were treated by assistant medical officers who had not the knowledge possessed by the doctors who sent them there

UNHEALTHY MONASTIC LIFE OF MENTAL HOSPITAL OFFICERS

Sir ERNEST GRAHAM LITTLE said it was difficult to obtain experience for students in maternity cases and the system of training students adopted in London was excellently adapted to meet the position One branch of medical practice in which little improvement had been made was that of mental diseases The reason lay in the faulty education that was offered and the faulty provisions made for medical officers in mental hospitals This applied in the provinces and London A case in the court of King's Bench last year established that it was possible under the Lunacy Act of 1890 for a visiting committee of a mental hospital to discharge an officer of the hospital without giving any reason The only officer recognized at such a hospital was the medical superintendent who was able to rule his community with an autocratic rule In an asylum which had been described to Sir Ernest no assistant medical officer could be absent without the leave of the medical superintendent and could only get away at all at the annual holiday He lived in the hospital was unable to marry and remained there sometimes for twenty years in that unhealthy monastic condition In addition these assistant medical officers were inadequately paid

They were trying to improve the training of officers in mental hospitals by instituting in every university an improved diploma in psychological medicine The training for such a diploma required an absence of at least six months at a recognized hospital and it was difficult to persuade medical officers at mental hospitals to take this extra qualification at their own risk Provision in the Minister of Health's Estimates for study leave would repay itself many times over Research had been stagnant in this department of medicine owing to the conditions in the hospitals many of them were antiquated and inadequate to deal with the cases which they took The chairman of the Mental Hospitals Committee of the London County Council had told him that for some time they had insisted on the diploma in psychological medicine but they now further insisted that their medical officers should also take the membership of the Royal College of Physicians of London—an onerous and difficult examination in which the failure rate was some 80 per cent The President of the Royal College deprecated the idea that this should be insisted on in the case of a mental hospital officer holding the diploma in psychological medicine To take an examination of that kind while at the same time working in the hospital was beyond the requirements of the case it put an intolerable strain on the officer Yet officers had been told they could not hope for promotion in the London County Council mental hospitals unless they had a good M D or M R C P$_2$ or both in addition to a diploma in psychological medicine and the qualification which put them on the register Sir Ernest also said that considerable dangers had to be faced in regard to the present position of the London County Council hospitals These had inadequate personnel as compared with voluntary hospitals One hospital with 400 beds had four assistant medical officers no house surgeon no house physician and no students Since 1929 these hospitals took a number of acute cases and one officer told him that in twenty months of service he was called upon to deal with 530 cases of illness caused by unskilled and dangerous attempted abortion

THE GENERAL PRACTITIONER'S PLACE IN THE HEALTH SYSTEM

Sir FRANCIS FREMANTLE said he would like to know the results of the mission which was sent out by the Ministry of Health to Scandinavia to inquire into the treatment of syphilis in Scandinavian countries This disease would continue to wreck the stamina of the nation unless it was tackled He hoped that Parliament would get to work on the dangers of the quack medicine trade the new Drugs Act would enable them to deal not only with popular patent medicines which medical men often prescribed themselves but with misleading advertisements in relation not only to medicines but to instruments Voluntary hospitals were on the rocks and not least the teaching hospitals Easier conditions of service and better rewards for the nurses and doctors employed in the hospitals would mean immense additional cost They must obtain some co operation with the municipal hospitals which would retain what was good in the voluntary hospital system and at the same time allow it to develop General practitioners should be the basis of the health system he hoped general practitioners united together as they were in the British Medical Association for the benefit of the public would be more consulted by the Government If from the first the doctors had been induced to work the Fitness Campaign it would have made greater progress

RESEARCH GRANTS DISCREDITABLE POSITION

Dr HADEN GUEST said that what was lacking in the frontal attack upon disease was a proper staff organization On the purification of rivers £7 000 000 was spent on water supply £4 500 000 on mental diseases £10 000 000 on patent medicines £30 000 000 annually but the grant in aid for medical research from the Government was £195 000 only It was discreditable that the Medical Research Council had to go cap in hand to funds in charge of private individuals Money from private research funds such as the Rockefeller Foundation should be spent on pioneering work Yet the Medical Research Council asked for money from such sources for research on rheumatism cancer and malaria For medical research work in connexion with the Ministry of Health that Ministry should provide at least £1 000 000 A private appeal had been launched to raise £500 000 for work on rheumatism That money should certainly be provided from Government funds

Mr BERNAYS replying to the debate said the number of maternity beds had increased in the last two years by 1 000

and plans were under consideration to increase that number further Mrs Tate had proposed to redistribute incurable mental patients to the old hospitals That was a council of despair The old hospitals should be brought up to date which was in fact being done Of 101 mental hospitals forty-five had separate admission units and fifty-five had separate convalescent units Each year that figure was improved and in due time all hospitals would have these units He believed that progress in well being in this country had been so swift as to commend the records of the Ministry of Health to the world

The Appropriation Bill was then read a third time

EPIDEMIOLOGICAL NOTES*

Poliomyelitis

A further case of infantile paralysis has occurred at Braintree, Essex, and 2 more suspected cases have been reported at Halstead—the first to be noted for over forty-eight hours The total number of cases reported which includes suspected and confirmed cases, is now 21, of which 1 has been fatal

The recent occurrence of this small outbreak of acute poliomyelitis in Essex, which appears to be on the wane, exemplifies well the epidemiological behaviour of the disease in this country, in which no large epidemics have ever been recorded, although on the average about 640 cases have been notified annually Within the last ten years the annual number has varied from 1,397 in 1936 to 394 in 1931 and 700 in 1935 In the same period large epidemics have been reported in Australia, the United States of America and Canada, and to a less extent in Europe—notably in Denmark The low incidence of the disease in this country probably increases rather than lessens the administrative difficulties in connexion with its control It may be difficult to decide whether the particular measures which have been adopted have exerted any influence on the course of the outbreak In outbreaks at Chicago in 1937 and in Manitoba in 1936 postponement of reopening of schools was regarded as the most important single measure in bringing the outbreak to an end and there is ample reason to believe that closure of day schools as has been carried out at Braintree is a desirable measure With regard to the disbanding of residential schools difference of opinion has been expressed by various authorities by placing such a closed community in strict quarantine the chances of spread to other areas are undoubtedly lessened, but the probability of infection among its members may be increased The interest of everyone concerned would be adequately safeguarded provided that the contact goes to a home in which there are no young children and is kept under medical supervision for a period of three weeks, when the likelihood of his developing the disease is remote Carriers and cases clinically so mild as to escape recognition may be responsible for spreading the disease but proof of their guilt in a given instance is rarely forthcoming For individuals who are intimately exposed, gargles and nasal douches with a solution of permanganate of potash 1 in 5 000 in 0 8 per cent of sodium chloride, should be employed More drastic measures such as instillation of alum tannic acid and picric acid have been advocated but their efficacy has not been established and the method is probably not free from risk of damage to the epithelial surfaces Immune serum taken from individuals convalescent from poliomyelitis may be used for passive immunization in special instances but it is not applicable on a large scale in this country while poliomyelitis remains a sporadic and comparatively infrequent disease

* Except where otherwise mentioned figures in parentheses refer to the week preceding the one under review

Diphtheria and Scarlet Fever

Notifications of diphtheria in England and Wales during the week under review fell from 1 075 to 1,031, but in London they rose from 153 to 155 There was a slight rise recorded in the notifications for Scotland—123, as against 121 in the previous week—while in Eire there was a definite fall the figures for the week being 45 compared with 58 in the previous week, in Northern Ireland a considerable rise was noted—37 as against 24 Deaths from diphtheria in the 126 Great Towns of England and Wales rose from 26 to 27, while in London they remained at 3 Of the 27 deaths recorded in the 126 Great Towns 3 (5) occurred in Liverpool 2 each in Newcastle upon-Tyne (0), South Shields (3) Stanley (0) There were 8 deaths from diphtheria in the 16 principal towns of Scotland during the week under review—3 (1) in Glasgow and 1 each in Edinburgh (1) Paisley (0), Motherwell and Wishaw (0) Hamilton (0) Ayr (0) There was an increase in the number of notifications of scarlet fever in England and Wales during the week—1 791 compared with 1,740—and in London —191 (168) In England and Wales the figures were considerably in excess of the median value for the last nine years There were 3 deaths from scarlet fever in the 126 Great Towns of England and Wales during the week

Primary and Influenzal Pneumonia

There was a drop in the notifications of primary and influenzal pneumonia in England and Wales during the week under review—528 to 493—and in London—37 to 33 the figure for England and Wales is above the median value for the last nine years, while that for London is well below

Typhoid Fever

Eight cases of typhoid fever were notified in Essex up to July 30 The outbreak began in the Tilbury area a week previously

Measles and Whooping-cough

There were 6 deaths from measles in the 126 Great Towns of England and Wales during the week under review compared with 5 in the previous week of these 2 (1) occurred in London and 3 (0) in Stoke on-Trent The number of cases reported in the L C C elementary schools during the week was 119 compared with 176 in the previous week while the average daily admissions to the L C C fever hospitals was 11 as against 9 in the previous week Notifications dropped in five of the metropolitan boroughs in which measles is notifiable remained the same in three and rose in three—Finsbury 11 (9) Lambeth 26 (15) and Shoreditch 3 (1) In Scotland the figures for measles rose during the week from 109 to 117 of these 46 (54) occurred in Kirkcaldy 36 (8) in Dunfermline and 6 (6) in Edinburgh As recorded last week there have been more deaths from whooping cough than from measles during the week in England and Wales—7 deaths from whooping cough as against 6 deaths from measles—but in London there was only 1 death from whooping cough while 2 deaths from measles were reported In Scotland there were 3 deaths from whooping cough (all in Glasgow)

Cholera

During the week ended July 23 505 cases of cholera with 204 deaths were reported in Shanghai, and in Hong Kong 3 cases with 33 deaths A further increase of the cholera incidence was noted in the Central Provinces and Berar—3 648 cases with 1 785 deaths—and in Bombay Presidency—150 cases with 71 deaths in the United Provinces on the other hand there is a decline in the number of cases reported —777 (1 682) with 388 deaths

Small-pox

During the week under review 2 cases of small pox were notified in Wigan county borough In the same week in Shanghai there were 6 cases of small pox with 2 deaths reported and in Hong Kong 2 cases with 2 deaths

No 29

INFECTIOUS DISEASES AND VITAL STATISTICS

We print below a summary of Infectious Diseases and Vital Statistics in the British Isles during the week ended July 23 1938

Figures of Principal Notifiable Diseases for the week and those for the corresponding week last year for (a) England and Wales (London included) (b) London (administrative county) (c) Scotland (d) Eire (e) Northern Ireland Median values for the last 9 years for (a) and (b)

Figures of Births and of Deaths recorded under each Infectious disease are for (a) The 126 great towns (124 in 1937) in England and Wales (including London) (b) London (administrative county) (c) The 16 principal towns in Scotland (d) The 13 principal towns in Eire (e) The 10 principal towns (9 in 1937) in Northern Ireland

A dash — denotes no cases a blank space denotes disease not notifiable or no return available

Disease	1938					1937 (Corresponding Week)					1929-37 (Median Value Corresponding Weeks)

Stillbirths Rate per 1 000 total births (including stillborn)	258 36	42 32				276 40	56 42					

After October 1 1933 puerperal fever was made notifiable only in the administrative county of London

† Death from puerperal sepsis.

‡ Includes primary form in figures for England and Wales London (administrative county) and Northern Ireland.

Medical News

The Royal College of Physicians of London is closed for cleaning etc and will reopen on Monday September 12

At a special meeting of the governors of The Warneford, Oxford held at New College Oxford on July 28 Dr Robert Gow McInnes M R C P Ed D P M was appointed physician superintendent of the hospital

A Royal Commission has been set up to investigate social and economic conditions in Jamaica Trinidad British Guiana British Honduras Barbados and the Leeward and Windward Islands The chairman is Lord Moyne, and one of the members is Dr Mary Blacklock, wife of Professor D B Blacklock of Liverpool She has been professor of pathology at Lady Hardinge College, Delhi and is now curator of the museum of the Liverpool School of Tropical Medicine and a member of the Colonial Advisory Medical Committee

An international balneological association has been founded in Budapest The first meeting will be held in Germany in 1938 the next in 1940 in France and the third in Italy in 1942 during the World Exhibition

A meeting of the Osler Club of London was held at the Langham Hotel on July 12 in honour of the eighty-ninth anniversary of the birth of Sir William Osler Dr Archibald Malloch delivered the eleventh Oslerian oration on Osler' recounting the story of his life and work in a happily personal way that made him live again Among those who spoke were Dr Harvey Cushing and Dr Charles Singer Thirty six members and friends sat down to dinner and honoured in silence the toast to the memory of Sir William Osler

QUERIES AND ANSWERS

Green Stools at 74

MEWT writes I have a patient aged 74 of active disposition but slightly neurotic He has been passing green stools for the last two months The tongue is fairly clean though there are symptoms of occasional gastritis notably some pain especially at night X ray examination has shown some diverticulitis The diet has been curtailed and kept simple and there has been an improvement lately in the condition Can anyone tell me what is the cause of the trouble and whether any treatment is of real value?

Finger-prints of Twins

Dr L W LA CHARD (St Kitts Leeward Islands) writes With reference to Dr R Cottens (May 21 p 1142) note on finger-prints of twins may I state that during the five years that I was occupied in inaugurating the finger print system in Northern Nigeria and was attached to Scotland Yard to study the system as carried out in England I came across many sets from known twins but never once did I see any that were identical One curious feature which I pointed out in my *Correlation of Finger prints and Racial Characteristics* (1913) was that in the cases of twins the whorl type of impression prevailed and the loop type was quite uncommon This incidentally is the mark of lower racial standard the higher the race in the ethnological scale the less the proportion of whorls and the greater the proportion of loops In monkeys several hundreds of whose digital impressions I recorded a loop is unknown It would seem that there is a field for research into atavistic possibilities and while I think there can be no doubt that finger prints of twins differ just as others do it is worthy of inquiry as to why they are definitely characterized by the predominance of the racially inferior type of impression

Syphilis in South Africa

Dr E E BARNETT (Sefhare Hospital Bechuanaland Protectorate) writes Here as in many parts of the Empire we are faced with a population largely syphilitic and much too poor to pay for treatment sufficient to cure the disease Treatment is therefore undertaken by the Government or Mission Hospitals Because of the enormous cost of adequate treatment even if it could be enforced the accepted aim in most areas like this is to sterilize the patient—that is to render him non infectious This is done by means of a short course of injections—for example six graded injections of N A B and a further six of bismuth In addition where necessary iodides are given by mouth. What I am anxious about is this Are we not encouraging the persistence of a strain of arsenic resistant spirochaete by this technique? If so is not our last state likely to be worse than our first when that minority of patients who are not rendered non infectious by treatment have again infected the population? I should be grateful for information as to whether any work has been done on this problem and, if so with what result

LETTERS, NOTES, ETC

The Medical Directory Uncommunicated Addresses

The Editor of the *Medical Directory* 104 Gloucester Place Portman Square London W 1 desires to notify members of the medical profession that certain of their number have not communicated to him their present addresses He asks that the persons in question will kindly give the information without delay Otherwise the words (*address uncommunicated*) will appear in lieu of an address in the forthcoming 1939 issue

Protest from Valhalla

We have received the following letter signed 'Fras Drake and written from *The Golden Hind* off Plymouth Ho I anxiously scanned your account of the B M A Annual Dinner at Plymouth in the hope that someone would have recalled the fact that it was actually held on the 350th anniversary of my fight with the Spanish Armada Apparently no one did I feel rather neglected especially as I married a Sydenham as your great Thomas Sydenham was so proud to remember

Unilateral Nystagmus

Mr SYDNEY TIBBLES (London W) writes A woman aged 70 was sent to me complaining that her sight was bad The results of the examination were as follows vision in the right eye 6/60 and Jaeger 6, not improved vision in the left eye, 6/18 and Jaeger 1, with glass 6/6 and Jaeger 1 Both eyes had a fair amount of mixed astigmatism and the right eye apart from a vertical nystagmus was normal the low degree of vision being the result of the nystagmus The movements were fine and rapid The general health was good and the patient who had no other nervous symptoms said she had always had this condition Most ophthalmic textbooks deny the possibility of unilateral nystagmus occurring though Gordon Holmes mentions it in an article on nystagmus in the *Dictionary of Practical Medicine*

Incompatible Blood Transfusion—A man aged 30 of blood group B had suffered for about eight weeks from a high remittent septicaemic fever when he was given a transfusion of blood supposed to come from a group B donor The patient reacted during the transfusion with nausea pain vomiting and collapse A rigor and a temperature of 104·8 F followed It transpired that the donor's blood belonged in reality to group O The patient's temperature fell below normal next day and thereafter remained normal Complete recovery was still maintained eight weeks after this transfusion The possible reasons why this blunder achieved such a dramatic therapeutic success are discussed
